Sheep's wool, unmanufactured, of the value of 20 cents per pound or less at the port of exportation, and hair of the alpaca, the goat, and other like animals, unmanufactured: *provided* that any wool of the sheep, or hair of the alpaca, the goat, and other like animals, which shall be imported in any other than the ordinary condition, as now and heretofore practiced, or which shall be changed in its character for the purpose of evading the duty, or which shall be reduced in value by the intentional admixture of dirt, or any foreign substance, to 20 cents per pound or less, shall be subject to pay a duty of 24 per cent. *ad valorem*, any thing in this act to the contrary notwithstanding.

SEC. 4. *And be it further enacted*, That all goods, wares, and merchandise which shall be in the public stores on the 1st day of July aforesaid, shall be subject, on entry thereof for consumption, to no other duty than if the same had been imported respectively after that day.

SEC. 5. *And be it further enacted*, That on the entry of any goods, wares, and merchandise imported on and after the 1st day of July aforesaid, the decision of the collector of the customs at the port of importation and entry, as to their liability to duty or exemption therefrom, shall be final and conclusive against the owner, importer, consignee, or agent of any such goods, wares, and merchandise, unless the owner, importer, consignee, or agent shall, within ten days after such entry, give notice to the collector in writing of his dissatisfaction with such decision, setting forth therein distinctly and specifically his grounds of objection thereto, and shall, within thirty days after the date of such decision, appeal therefrom to the Secretary of the Treasury, whose decision on such appeal shall be final and conclusive; and the said goods, wares, and merchandise shall be liable to duty or exempted therefrom accordingly, any act of Congress to the contrary notwithstanding, unless suit shall be brought within thirty days after such decision for any duties that may have been paid or may hereafter be paid on said goods, or within thirty days after the duties shall have been paid, in cases where such goods shall be in bond.

AN ACT TO AMEND THE ACT REDUCING THE DUTY ON IMPORTS, AND FOR OTHER PURPOSES, PASSED JULY 30, 1846.

Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled, That the eighth section of the act approved July 30, 1846, and entitled "An act reducing the duty on imports, and for other purposes," be amended as follows:

SEC. 2. *And be it further enacted*, That it shall be lawful for the owner, consignee, or agent of imports which have been actually purchased or procured otherwise than by purchase, on entry of the same, to make such addition in the entry to the cost or value given in the invoice as, in his opinion, may raise the same to the true market value of such imports in the principal markets of the country whence the importation shall have been made; and to add thereto all costs and charges which, under existing laws, would form part of the true value at the port where the same may be entered, upon which the duties should be assessed. And it shall be the duty of the collector within whose district the same may be imported or entered to cause the dutiable value of such imports to be appraised, estimated, and ascertained, in accordance with the provisions of existing laws; and if the appraised value thereof shall exceed by 10 per cent. or more the value so declared on the entry, then, in addition to the duties imposed by law on the same, there shall be levied collected, and paid, a duty of 20 per cent. *ad valorem* on such appraised value: *Provided, nevertheless*, That under no circumstances shall the duty be assessed upon an amount less than the invoice or entered value, any law of Congress to the contrary notwithstanding.

Approved March 3, 1857.

Tarpauling, a broad piece of canvas well daubed with tar, and used to cover the hatchways of a ship at sea, to prevent the penetration of the rain or sea-water which may at times rush over the decks.

Tartar (Gr. *raprapos*, infernal; because it is the sediment or dregs of wine), the substance which concretes upon the inside of wine-casks. It is called red and white *argol*, according to the wine from which it is obtained. When purified it is often called *cream of tartar*: it is a bitartrate of potash.—See ARGAL.

Tasman, Abel Jansen. History is silent in regard to the early days of this navigator and geograph-

ical discoverer. He was a Hollander by birth, and appointed by the Dutch East India Company to the command of three vessels which they had fitted out at Batavia for the discovery of new countries and a more extended commercial power. Tasman sailed September 5, 1642, and the first-fruits of his enterprise was the discovery of that part of New Holland called Van Diemen's Land, which the navigators made on 24th November. Early in December they set out again, and on the 13th they first saw the islands of New Zealand, on which the natives successfully opposed his landing. After visiting several islands in the South Sea, some of which were previously unknown, he returned to Batavia, June 15th, 1643, having sailed round the southern hemisphere of the globe. The short-sighted policy of the Dutch East India Company prevented the publication of any account of this voyage, but a map or chart of the discoveries of Tasman was preserved at the Stadt House at Amsterdam, and some years after Dirk Rembrandts published an extract from the journal of this enterprising seaman, of which later geographical writers have been content to avail themselves. In 1856 a proposition was made in England to restore to the whole district hitherto (but unjustly)

known as Van Diemen's Land, the name of *Tasmania*, in meritorious honor of its original discoverer.

Tatta, a town in the territory of Sinde, situated about 60 miles in a direct line from the sea, at a short distance from the western bank of the River Indus, in lat. 24° 44' N., long. 68° 17' E. Population uncertain, probably about 8000. The streets are narrow and dirty; but the houses, though built of mud, chopped straw, and timber, are superior to the low huts seen in the adjoining towns and villages. Being situated a little above the part where the Indus divides into the two great branches by which its waters are poured into the Indian Ocean, it might be supposed that Tatta would be a place of great trade. But, owing to the unwholesomeness of the climate, the barbarism of the tribes on its banks, and other causes, its commerce has never corresponded with what might have been anticipated, looking at its position on the map. It had probably attained the acme of its prosperity in the beginning of the 16th century. In 1555 the Portuguese, by way, as they stated, of avenging the treachery of the King of Sinde, inhumanly massacred 8000 of the inhabitants, and burned the town. — *Conquêtes des Portugais*, tome iv. p. 183. It is probable that Tatta never fully recovered from this dreadful blow; but Mr. Hamilton mentions that in the 17th century it was extensive and populous, possessing much commerce, with manufactures of silk, wool, and cabinet ware. The decayed state in which we now find it has been a consequence of the misgovernment and rapacity of its present rulers, the Ameers of Sinde, under whose sway it fell more than 50 years ago. In 1635 the English established a factory at Tatta, in the view of facilitating the disposal of woolens and other goods in the countries traversed by the Indus; and the building occupied by the factory, though far from magnificent, was recently, if it be not still, the best, not in Tatta only, but in the whole country of Sinde. The chief exports are rice, shawls from Cashmere, opium from Malwah, hides, ghee, cotton, goats' wool, carpets, drugs, etc. Putchock, an article largely consumed in China, is a peculiar export of Sinde. The imports comprise a variety of articles, but the quantities are trifling: they consist principally of spices, dye-stuffs, hardware, tin, iron, etc., broadcloths, English cottons, silks, etc. But at present the trade is quite considerable; and no one could believe, *à priori*, that the natural emporium of so great a river as the Indus, traversing many extensive countries, would cut so insignificant a figure in the trading world.

A very well-informed party, Dr. Buist, editor of the *Bombay Times*, has, in his work on the late expedition into Afghanistan, made the following observations on the trade of the Indus:

"The glowing descriptions of Burnes appear to have given a very exaggerated idea of the value of the internal traffic of the countries beyond the Indus. It was forgotten that where there was no industry, no manufactures or mineral wealth, no sea-coast or rivers

to permit exportation, there could be little or nothing to give in exchange for imports; and that the wants of a population purely nomade must at all times be simple and singularly few. The whole of our commerce with Persia has never exceeded two millions sterling a year, rarely above one; the total of our trade with Afghanistan certainly never exceeded a million annually, and has very rarely amounted to much more than the half of one. Besides this, the Indus in reality was never closed save by its own dangerous entrances and shallow depth of water. Lord Ellenborough has opened the Indus as far as Mithen Kote; and the Sutlej, in continuation of this, to the Markunda, where it ceases to be navigable for the smallest craft. Yet the gross value of the British goods consumed by the countries adjoining does not at present amount to a quarter of a million sterling, and will not, in all likelihood, be doubled for ten years to come; the expense of maintaining troops between Kurrachee and Bukkur, both stations included, exceeding £600,000 a year; with a less force it would be unwise to think of keeping these stations at all. The great line of traffic was not along but across the Indus, by the Delhi frontier, or parallel to it at a distance of 100 miles, by Soumeanee and Kelat. The countries beyond the Indus, besides, have always been open to the free admission of every variety of foreign imports on paying a moderate fixed duty. The chief obstruction in reaching these is irremediable by treaty, and arises from the attacks of the plundering tribes in the passes, which can not be restrained save by the payment of a black mail or subsidy."

The delta of the Indus has little in common with the delta of the Nile, except its shape. Not a fourth part of it is cultivated, and its few inhabitants principally lead a pastoral life. It is overgrown with tamarisks and other wild shrubs; and though intersected by the numerous mouths of the river, its surface is dry and arid, being almost destitute of fresh water.

Tax (Welsh *Tasg*; Fr. *Taxe*; Du. *Taxe*), a rate or duty laid by government on the income or property of individuals; an impost, a tribute, or an excise, according to the method of collecting, or the property from which collected. The first taxes levied on the people were by Solon, the first Athenian legislator, 540 B.C. The first class of citizens paid an Attic talent of silver, about £55 sterling. The next was by Darius, the son of Hystaspes, which was a land-tax by assessment, and deemed so odious that his subjects styled him, by way of derision, "Darius the Trader," 480 B.C.—*D'Eon's Historie des Finances*. Taxes in specie were first introduced in England by William I., 1067, and he raised them arbitrarily; yet subsidies in kind, as in wool, corn, and other products of England, continued till the accession of Richard II., 1377.—HAYDN.

The following table exhibits the several taxes of all the states of which there are any returns, and shows the aggregate of the taxes of each state, and also of the separate species of tax:

ANNUAL TAXES IN THE UNITED STATES, 1850.

Adam Smith lays down four general maxims upon the subject of taxation; which are as follows: "1. The subjects of every state ought to contribute toward the support of the government as nearly as possible in proportion to their respective abilities; that is, in proportion to the revenue which they respectively enjoy under the protection of the state." 2. The tax which each individual is bound to pay ought to be certain, and not arbitrary. The time of payment, the manner of payment, the quantity to be paid, ought all to be clear and plain to the contributor, and to every other person. 3. Every tax ought to be levied at the time, or in the manner most likely to be convenient for the contributor to pay it. 4. Every tax ought to be so contrived as both to take out and keep out of the pockets of the people as little as possible over and above what it brings into the public treasury of the state."

The subject of taxation is ably discussed in the *Edinburgh Review*, xxxiii. xc.; *Democratic Review*, xx.; *Quarterly Review*, xxxv.; *American Quarterly Register*, viii. For further articles, see DE BOW'S *Review*, xiii.; HUNT'S *Merchants' Magazine*, iv.; *Southern Review*, viii.; *North American Review*, xix. (DU PONCEAU); *Westm. Review*, xli., xlii.

Tea (in one Chinese dialect, *Cha*, in another *Te*; *Du Te*; *Fr. Thé*; *It. Te*; *Russ. Tchai*; *Hind. Cha*; *Malay, Teh*), the leaves of the tree or shrub (*Thea viridis*, Linn.). The tea-plant ordinarily grows to the height of from three to six feet, and has a general resemblance to the myrtle, as the latter is seen in congenial situations in the southern countries of Europe. It is a polyandrous plant, of the natural order *Columnifera*, and has a white blossom, with yellow style and anthers, not unlike those of a small dog-rose. The stem is bushy, with numerous branches, and very leafy. The leaves are alternate, on short, thick, channelled footstalks, evergreen, of a longish elliptic form, with a blunt, notched point, and serrated except at the base. These leaves are the valuable part of the plant. The *Camellias*, particularly the *Camellia sasanqua*, of the same natural family as the tea-tree, and very closely resembling it, are the only plants liable to be confounded with it by a careful observer. The leaves of the particular *camellia* just named are, indeed, often used in some parts of China as a substitute for those of the tea-tree. The effects of tea on the human frame are those of a very mild narcotic; and, like those of many other narcotics taken in small quantities—even of opium itself—they are exhilarating. The green varieties of the plant possess this quality in a higher degree than the black; and a stronger infusion of the former will, in most constitutions, produce considerable excitement and wakefulness. Of all narcotics, however, tea is the least pernicious; if, indeed, it be so in any degree, which we very much doubt.

The tea shrub may be described as a very hardy evergreen, growing readily in the open air, from the equator to the 45th degree of latitude. For the last sixty years it has been reared in this country, without difficulty, in green-houses; and thriving plants of it are to be seen in the gardens of Java, Singapore, Malacca, and Penang; all within six degrees of the equator. The climate most congenial to it, however, seems to be that between the 25th and 23d degrees of latitude, judging from the success of its cultivation in China. For the general purposes of commerce, the growth of good tea is confined to China; and is there restricted to five provinces, or rather parts of provinces; viz., Fokien and Canton, but more particularly the first, for black tea; and Kiang-nan, Kiang-si, and Che-kiang, but chiefly the first of these, for green. The tea districts all lie between the latitudes just mentioned, and the 115th and 122d degrees of east longitude. However, almost every province of China produces more or less tea, but generally of an inferior quality, and for local consumption only; or when of a superior quality, like some of the fine wines of France, losing its flavor when

exported. The plant is also extensively cultivated in Japan, Tonquin, and Cochin-China; and in some of the mountainous parts of Avis; the people of which country use it largely as a kind of *pickle preserved in oil*. Botanically considered, the tea-tree is a single species; the green and black, with all the diversities of each, being mere varieties, like the varieties of the grape, produced by difference of climate, soil, locality, age of the crop when taken, and modes of preparation for the market. Considered as an object of agricultural produce, the tea-plant bears a close resemblance to the vine. In the husbandry of China, it may be said to take the same place which the vine occupies in the southern countries of Europe. Like the latter, its growth is chiefly confined to hilly tracts, not suited to the growth of grain. The soils capable of producing the finest kinds are within given districts, limited and partial. Skill and care, both in husbandry and preparation, are quite as necessary to the production of good tea as to that of good wine.

Cultivation.—The best wine is produced only in particular latitudes, as is the best tea; although, perhaps, the latter is not restricted to an equal degree. Only the most civilized nations of Europe and America have as yet succeeded in producing good wines; which is also the case in the East with tea; for the agricultural and manufacturing skill and industry of the Chinese are there unquestionably pre-eminent. These circumstances deserve to be attended to in estimating the difficulties which must be encountered in any attempt to propagate the tea-plant in colonial or other possessions. These difficulties are obviously very great, and perhaps all but insuperable. Most of the attempts hitherto made to raise it in foreign countries were not, indeed, of a sort from which much was to be expected. Within the last few years, however, considerable efforts have been made by the Dutch government of Java to produce tea on the hills of that island; and having the assistance of Chinese cultivators from Fokien, who form a considerable part of the emigrants to Java, a degree of success has attended them, beyond what might have been expected in so warm a climate. The Brazilians have made similar efforts; having also, with the assistance of Chinese laborers, attempted to propagate the tea shrub near Rio de Janeiro; and a small quantity of tolerably good tea has been produced. But owing to the high price of labor, and the quantity required in the cultivation and manipulation of tea, there is no probability, even were the soil suitable to the plant, that its culture can be profitably carried on in that country. It may, perhaps, succeed in Assam, where its culture is now being attempted; for labor is there comparatively cheap, and the hilly and tablelands are said to bear a close resemblance to those of the tea districts of China; but we are not sanguine in our expectations as to the result.

Cultivation of the Tea-plant in the United States.—This plant, which has so long afforded a most grateful beverage to millions of people in every civilized country of the globe, there is much reason to believe, may be successfully cultivated in favorable situations and under proper management, for local consumption, at least, in most, if not all of our Southern States. This was partially realized from an experiment made at Greenville, in the mountainous parts of South Carolina, by the late Junius Smith, in 1848 to 1852. He imported several cases of black and green tea plants, of Chinese stock, of from five to seven years' growth, and planted them in the village above named, where they remained about two years. On their removal to a plantation in that vicinity, in March, 1851, Dr. Smith stated that "they grew remarkably last summer, and are now fully rooted, with fine large main and collateral roots, with an abundance of fibrous radicles. They all stood the snow, eight or nine inches deep upon the level on the 3d of January, and the severe frosts of winter, without the slightest covering or protection,

and without the loss of a single plant. They are now all forming part of the plantation, composed of those received from China last June, and a few planted the first week in June, which germinated the 17th of September. All these young plants were thinly covered with straw. Some of them have lost their foliage; others have not. The stems do not appear to have sustained any injury. The fresh buds are beginning to shoot. I can not help thinking that we have now demonstrated the adaptation of the tea-plant to the soil and climate of this country, and succeeded in its permanent establishment within our borders."

Considering the practical bearing this subject has on the economy and agricultural interests of our Southern States, it is surprising that a single herb, which has proved of such universal acceptance, should retain this position in the world for centuries, and yet still continue to be restricted in its production almost entirely to the country of its origin, although corresponding regions, with respect to latitude, elevation above the sea, and other circumstances, which modify the climate, are open to its introduction and culture, and the most intelligent, as well as the most enterprising merchants and others have ever sought to learn every fact connected with its growth and subsequent preparation. Though regarded, in general, as a luxury, and by some even as food, yet it is not an article from which the people of any country should be debarred. On the contrary, it is the policy in this case, as well as in most others, of every government to gratify the wishes of its people, and to facilitate the acquisition of this luxury by its economical importation, or, what would be far more desirable, to extend the production to its own soil. Respecting the expediency of such a measure in this country as that last named, little more need be stated than that most of our citizens will have it, and millions of dollars will annually be paid for its importation. To the argument which has often been advanced, that the very low rate of wages in China is the reason why the production of tea has not been encouraged in this country, it may be stated that, with improved machinery and other appliances, facility of transportation, robust and well-fed laborers, and probably with the aid of the Chinamen now in California, there can be little doubt that we can successfully compete, at least for local consumption, with the primitive utensils, tedious manipulations, and absence of railroads, canals, steam navigation, and even of common roads, of the enfeebled and poorly-fed Asiatics. The cost of the transportation of tea in China, say at a distance, upon an average, from the plantations to Canton, the port of shipment, of 800 to 1000 miles, at a waste of from six weeks' to two months' time, whole cargoes being constantly carried upon the backs of porters, is about four cents a pound, or about one-third of its value at the place of its growth. It is supposable that in no part of the United States, at a corresponding distance from the sea-board, would the cost of carriage be equal to one-fourth of that sum, or occupy one-tenth of the time. Dr. Jameson, superintendent of the tea plantations of the East India Company, on the Himalayan Mountains, in his report of 1847, remarks that the task-work of one laborer is to dress, weed, and keep in order three acres of tea land. In our Middle and Southern States one hand cultivates annually, and keeps in order, six acres of cotton, or fifteen of Indian corn. Therefore, assuming the amount of time for cultivating the respective crops to be equal, the American laborer would perform more than double the amount of work done by the Hindoo, which, undoubtedly, is about the difference in their physical force.

The tea-plant is not only found in China and Japan, chiefly in a cultivated state, but is indigenous in the mountains which separate China from the Burmese territories, especially in Upper Assam, bordering on the province of Yun-nan. It is also cultivated in Nepal, at an elevation of four thousand seven hundred

and eighty-four feet above Bengal, in latitude $27^{\circ} 42' N$.

Before proceeding in the inquiry, it would be desirable to ascertain whether one or several species of the genus *Thea* yield the several varieties of tea, as this might explain some of the discrepancies in the accounts respecting the soil and climate required for its cultivation. Some authors, among whom are Mr. Fortune and Dr. Lettson, who traveled extensively in China, and had ample opportunities for investigating this subject, consider that all the varieties of tea may be obtained from the same plant, and that the differences are therefore due to the soil or climate, or to the age of the leaf and the mode of preparation. Others, on the contrary, are of the opinion that they are produced from at least two distinct species, *Thea viridis* and *Thea bohea*. There is no doubt, however, that the plants usually known as "Green" and "Black," when cultivated under similar circumstances, retain permanently their characteristics, and that their leaves, respectively, generally resemble those obtained after infusing good specimens of green and black tea. The green-tea-plant, moreover, is much more hardy than the black; one of the former having lived twenty years in the open air, near London, and being only killed in the very severe winter of 1837-'38, when the thermometer fell to $4\frac{1}{2}^{\circ} F$. Yet, from the great extent of territory over which the tea-plant is found, and from the variety of situations in which it is produced, there can be but little doubt that it is grown in very different soils, though there are, doubtless, certain physical conditions that are best suited to the production of the finest-flavored teas.

The tea-plant loves to grow in valleys, at the foot of mountains, and upon the banks of streams, where it enjoys a southern exposure to the sun, though it endures considerable variations of dryness and moisture, and of heat and cold; for it flourishes in the climate of Pekin, in latitude 40° , as well as about Canton, in $23^{\circ} 8' N$; and it is observed that the degree of cold at the former place is nearly as severe in winter as it is in some of our Middle States. The best tea, however, grows in a mild, temperate climate, the country about Nankin producing a better article than either Pekin or Canton. Mr. Bruce, who traveled in Upper Assam in 1836, describes the tea districts as consisting of little mounds or hillocks of earth, on which large trees had grown, their roots alone appearing to save them from being washed away. One thing he observes as worthy of notice, that all the Assam tea grows near water, of which it appears to be very fond, for wherever there is a small stream tea is sure to be found. He subsequently discovered, however, that tea plantations in that country were very extensive, both on the hills and in the plains. But excessive moisture, either in the soil or in the air, is not congenial to the growth of the tea-plant, as it is evident from its preference for sandy or porous soils, or the moulds, in the moist climate of Assam, but which probably would not be requisite where the climate is dry.

Mr. Fortune, who had frequent opportunities to inspect some of the most extensive tea districts of Canton, Fokein, and Chekiang, states that the soil of those of the northern provinces is much richer than it is in Quantung. "Tea shrubs," he says, "will not succeed well unless they have a rich sandy loam to grow in. The continual gathering of their leaves is very detrimental to their health, and, in fact, ultimately kills them. Hence a principal object with the grower is to keep his bushes in as robust health as possible; and this can not be done if the soil be poor. The tea plantations in the north of China are always situated on the lower and most fertile sides of the hills, and never on the low lands. The shrubs are planted in rows, about four feet apart, and about the same distance between each row, and look at a distance like little shrubberies of evergreens. The farms are small,

each consisting of from one to four or five acres; indeed, every farmer has his own little tea garden, the produce of which supplies the wants of his family, and the surplus brings him in a few dollars that are spent on the other necessities of life." In Japan, tea is planted around the borders of fields, without regard to situation or soil.

Species of Tea.—The tea-plants are raised from nuts, or seeds, usually sown where they are to remain. Three or more are dropped into a hole, and covered with earth four or five inches deep; these come up without any further trouble, and require little culture, except that of removing weeds. The leaves are not collected from the cultivated plants until they are three years old; and, after growing nine or ten years, they are cut down, in order that the young shoots, which will then rise, may afford a greater supply of leaves. The best time to gather the tea is while the leaves are small, young, and juicy. The first gathering usually commences at about the end of February, when the leaves are young and unexpanded; the second about the beginning of April; and the third in June. The first collection, which only consists of fine tender leaves, is most esteemed, and is called by us "Imperial" tea. The second is denominated "Tootsjaa," or Chinese tea, because it is infused and imbibed after the Chinese manner. The last gatherings, which are the coarsest and cheapest of all, are drunk by the people of the lowest class. Besides the three kinds of tea named above, it may be observed that, by sorting these, the varieties become still further multiplied. The Chinese, however, know nothing of "Imperial" tea, "Flower" tea, and many other names, which in Europe and America serve to distinguish the quality and the price of the article; but, besides the common tea, they distinguish two other kinds, namely, the "Voui" and "Soumlo," which are reserved for people of the first order of society, and for those who are sick. The principal varieties used in Europe and in this country are the "Green" tea, which is the "Bing," or common tea of the Chinese, and is gathered in April; the "Voui," or "Vou-tche," a delicate kind of "Young Hyson," which differs only from the other in being gathered a few weeks earlier, and consists of the young leaf-buds just as they begin to unfold; and the various descriptions of "Black" tea, which diminish in quality and value as they are collected later in the season, until they reach the lowest kind, called by us "Bohea," and by the Chinese "Ta-cha," or large tea, on account of the maturity and size of the leaves. The early leaf-buds, in spring, being covered with a white, silky down, are gathered to make "Pekoe," a corruption of the Canton word *Pa-ko*, white down. A few days' later growth produces what is sometimes styled "Black-leaved Pekoe." The more fleshy and matured leaves constitute "Souchong;" as they grow still larger and coarser, they form "Congo;" and the last and latest picking of all is the "Bohea." The variety named above, called "Voui," is a scarce and expensive article, and the picking of the leaves in so young a state does considerable injury to the plantations. The summer rains, however, which fall copiously about this season, moisten the earth and air, and, if the plants are young and vigorous, they soon push out fresh leaves.

The process of gathering tea is one of great nicety and importance. Each leaf is plucked separately from the twig; the hands of the gatherer are kept clean; and in collecting some of the finer sorts, it has been stated, upon credible authority, that he is obliged for some weeks previous to abstain from all gross food, lest his breath or perspiration might injure the flavor; to wear fine gloves while at work, and to bathe two or three times a day during this period. In the general harvest seasons, the natives are seen in little family groups on the side of every hill, when the weather is dry, engaged in gathering the tea leaves, which are stripped off rapidly and promiscuously into round

baskets, made for the purpose, of split bamboo or rattan. When a sufficient quantity is gathered, it is carried home to the cottage or barn, where the operation of drying is performed. The Chinese dislike gathering the leaves on a rainy day for any description of tea, and never will do so unless necessity requires it. Some even pretend to distinguish the teas made on a rainy day from those made on a sunny day. The process of rolling and drying the leaves, it is stated, can only be learned by actual experience; yet the system adopted to attain this end is as simple as it is efficacious. Let it be borne in mind, however, that the grand object is to expel the moisture, and at the same time to retain as much as possible of the aromatic and other desirable secretions.

As to the differences of flavor and color peculiar to the green and black teas, it is well known that, in many instances, they are produced by art. In describing the green teas grown in the districts of Chekiang, Mr. Fortune remarks that "it must not be supposed that they are the green teas which are exported. The leaf has a much more natural color, and has little or none of what we call the beautiful bloom upon it, which is so much admired in Europe and America. There is now no doubt that all these blooming green teas, which are manufactured at Canton, are dyed with Prussian blue and gypsum, to suit the tastes of the 'foreign barbarians!' Indeed, the process may be seen any day during the season by those who will give themselves the trouble to seek after it. It is very likely that the same ingredients are also used in dyeing the northern green teas for the foreign market." The Chinese, it is asserted, never use these dyed teas themselves; and certainly their taste in this respect is more correct than ours. It is not to be supposed that the dye employed can produce any very bad effects upon the consumer, for, had this been the case, it would have long since been discovered. As to the opinion that green tea owes its verdure to an inflorescence acquired from plates of copper, on which it is supposed to be curled or dried, there is no foundation for the suspicion, as the infusions undergo no change on the addition of volatile alkali, which would detect the minutest portion of copper by turning the liquors blue. And, besides, the drying pans and furnaces used throughout China for this purpose are said to be invariably made of sheet-iron.—*Patent Office Report.*

Adulteration of Tea.—It might have been anticipated, from the high price of and the high duties in some countries on tea, and the facility with which it may be mixed up with foreign substances, that it would not escape adulteration; and the records of the courts of justice show that this is the case, several dealers having been convicted of this pernicious practice. The adulteration is usually effected either by the intermixture of sloe or ash leaves with fresh teas, or by mixing the latter with tea that has been already used. The penalties on such offenses are not specific; and the best, or rather the only, security on which any reliance can be placed, is to be found in the character and respectability of the parties dealing in tea. Even were he influenced by nothing else, it would be extreme folly in any person carrying on an extensive business to engage in such dishonest practices, for they can hardly fail of being detected; and the ruin of his business that would follow such exposure would far more than balance whatever gains he could hope to make by his fraudulent schemes.

Tea Trade in China.—The tea merchants commonly receive advances from the principal merchants and other capitalists of Canton; but, with this exception, are altogether independent of them; nor have the latter any exclusive privilege or claim of pre-emption. They are very numerous; those connected with the green-tea districts alone being about four hundred in number. The black-tea merchants are less numerous, but more wealthy. The greater part of the tea is

brought to Canton by land carriage or inland navigation, but chiefly by the first. It is conveyed by porters; the roads of China, in the southern provinces, not generally admitting of wheel carriages, and beasts of burden being very rare. A small quantity of black tea is brought by sea, but probably smuggled; for this cheaper mode of transportation is discouraged by government, which it deprives of the transit duties levied on inland carriage. The length of land carriage from the principal districts where the green teas are grown to Canton is probably not less than 700 miles; nor that of the black tea, over a mountainous country, less than 200 miles. The tea merchants begin to arrive in Canton about the middle of October, and the busy season continues until the beginning of March; being briskest in November, December, and January. Tea, for the most part, could, previously to the late changes, only be bought from the hong or licensed merchants; but some of these, the least prosperous in their circumstances, were supported by wealthy *outside* merchants, as they are called; and thus the trade was considerably extended. The prices in the Canton market vary from year to year with the crop, the stock on hand, and the external demand, as in any other article and in any other market. After the season is over, or when the westerly monsoon sets in, during the month of March, and impedes the regular intercourse of foreigners with China, there is a fall in the price of tea, not only arising from this circumstance, but from a certain depreciation in quality, from the age of the tea; which, like most

other vegetable productions, is injured by keeping, particularly in a hot and damp climate.

There seems to be little mystery in the selection and purchase of teas; for the business is both safely and effectively accomplished, not only by the supercargoes of the American ships, but frequently by the masters; and it was ascertained by the sales at the East India House, that there was no difference between the qualities of the teas purchased by the commanders and officers of the company's ships, without assistance from the officers of the factory, and those purchased for the company by the latter. An unusual degree of good faith, indeed, appears to be observed on the part of the Chinese merchants with respect to this commodity; for it was proved before the select committee of the House of Commons, in 1830, that it was the regular practice of the hong merchants to receive back, and return good tea for, any chest or parcel upon which any fraud might have been practiced, which sometimes happens in the conveyance of the teas from Canton on board ship. Such restitution has occasionally been made, even at the distance of one or two years. The company enjoyed no advantage over other purchasers in the Canton market except that which the largest purchaser has in every market, viz., a selection of the teas, on the payment of the same prices as others; and this advantage they enjoyed only as respects the black teas, the Americans being the largest purchasers of green teas.

We herewith subjoin a table for calculating the cost of tea:

COMPARISON OF THE COST OF TEA PER PICUL (133½ LBS. AVOIRDUPOIS), WITH THE RATE PER POUND, AND TON OF 9 CWT. OR 1008 POUNDS PER TON.

Per Picul.	Exchange 4s. per Dollar.			Exchange 4s. 3d. per Dol.			Exchange 4s. 4d. per Dol.			Exchange 4s. 5d. per Dol.			Exchange 4s. 6d. per Dol.

Consumption of Tea in Europe.—Of the Continental states, Russia and Holland are the only ones in which the consumption of tea is considerable. In 1848 the imports of tea into Russia amounted to 253,429 poods, or 9,123,444 pounds, in chests, and 116,249 poods in bricks. The former consists almost entirely of the finest varieties of black tea. The consumption of tea in Holland amounts to about 3,000,000 pounds a year, the duty on which varies from 1½d. to 4½d. per pound. The consumption of France does not exceed 350,000

pounds. The importations into Hamburg vary between 1,500,000 and 2,000,000 pounds, the greater part of which is forwarded to the interior of Germany.

The Tea Trade of the United States.—Tea is the chief article imported from China into the United States. The consumption of the United States amounts to from

30,000,000 to 32,000,000 pounds a year. Duties on tea used to form one of the largest items of American revenue, having in some years produced \$3,250,000. Their magnitude, however, was justly complained of; and it is probably owing to this circumstance that, while the consumption of tea was for several years pretty stationary in the United States, that of coffee increased with even greater rapidity than in England. The Secretary of the Treasury of the United States, in his Report for 1827, observed: "The use of tea has become so general throughout the United States, as to rank almost as a necessary of life. When to this we add that there is no rival production at home to be fostered by lessening the amount of its importation, the duty upon it may safely be regarded as too high. Upon some of the varieties of the article it considerably exceeds 100 per cent., and is believed to be generally above the level which a true policy points out. A moderate reduction of the duty will lead to an increased consumption of the article, to an extent that, in all probability, would in the end rather benefit than injure the revenue. Its tendency would be to enlarge our trade and exports to China—a trade of progressive value, as our cottons and other articles of home production (aside from specie) are more and more entering into it. It would cause more of the trade in teas to centre in our ports; the present rate of duty driving our tea ships not unfrequently to seek their markets in Europe, not in the form of re-exportation, but in the direct voyage from China. It would also serve to diminish the risk of the United States losing any portion of a trade so valuable, through the policy and regulations of other nations." These judicious suggestions could not fail to command attention; and the flourishing state of the revenue in subsequent years having admitted of a very great reduction of duties, those on tea were wholly repealed. As was to be expected, the consumption has since rapidly increased. The whole imports from China to the United States in 1855 amounted to \$11,048,726, of which tea covered \$6,806,463. In 1854 the total imports reached \$10,506,329, of which tea amounted to \$6,545,115; and in 1853, \$10,573,710, of which tea covered \$8,174,670.

ESTIMATE, IN POUNDS' WEIGHT, OF THE QUANTITIES OF TEA EXPORTED BY SEA FROM CHINA IN 1851-'52, SPECIFYING THE COUNTRIES FOR WHICH THE SAME WERE SHIPPED, AND THE QUANTITY SHIPPED FOR EACH.

Countries.	Pounds.
The United Kingdom	65,100,000
The United States	34,327,000
Australia	8,829,000
Holland	3,000,000
India	500,000
Other places	2,200,000
Total	113,856,000

The exports of tea to Russia by land amount to 14,000,000 or 15,000,000 pounds a year.

The following tables afford a review of the quantities of tea imported into the United States from China since the commencement of that trade, so far as they can be gathered from various official returns:

1800.....	3,797,634	1812.....	3,066,089
1801.....	4,086,960		

Deducting the quantities ascertained to have been exported from the United States during the above period, we find the average annual consumption in the country to have been 3,350,000 pounds for twelve years, from 1801 to 1812, inclusive. From 1813 to 1820, inclusive, the total amount consumed or on hand can alone be given. It approximates very closely, how-

ever, the total amount imported during that period, and was as follows: Teas consumed or on hand, 26,717,917 pounds; or an average annual quantity of 3,339,740 pounds. The quantities of teas of all kinds imported into and exported from the United States, from 1821 to 1833, inclusive, together with the quantities retained for consumption, are shown as follows:

Years.	Imported. Pounds.	Exported. Pounds.	Consumed. Pounds.
1821.....	4,975,646	531,691	4,443,955
1822.....	6,639,434	1,333,846	5,305,588
1823.....	8,210,010	1,735,076	6,474,934
1824.....	8,534,487	1,148,868	7,385,619
1825.....	10,203,548	2,036,808	8,173,740
1826.....	10,098,900	1,998,672	8,100,228
1827.....	5,875,638	1,626,417	4,249,221
1828.....	7,707,427	1,417,946	6,289,581
1829.....	6,636,790	1,018,343	5,618,447
1830.....	8,609,451	1,736,324	6,873,091
1831.....	5,182,867	526,196	4,656,691
1832.....	9,906,606	1,279,262	8,627,344
1833.....	14,639,822	1,712,779	12,927,043

If from the imports are deducted the exports for each year, an average annual consumption, for the entire period, of 7,000,000 pounds will be given. The following statement shows the imports and exports of tea, the quantity remaining on hand or consumed each year, from 1834 to 1841, exclusive of 601,319 pounds imported during the entire period from other countries than China:

Years.	Imported. Pounds.	Exported. Pounds.	Consumed. Pounds.
1834.....	10,282,877	3,681,308	13,201,669
1835.....	14,415,572	2,832,506	12,332,706
1836.....	16,382,114	1,836,342	14,485,772
1837.....	16,982,384	2,568,586	14,473,988
1838.....	14,418,112	2,435,302	11,982,810
1839.....	9,349,817	1,592,093	7,767,784
1840.....	20,066,535	3,123,496	16,883,049
1841.....	11,560,301	666,532	10,899,469
Total.....	119,397,872	17,380,565	102,017,307

The preceding table will show that the average annual amount consumed, or retained on hand, during this period, was 12,752,163 pounds. The following statement exhibits the values of all imports from China into the United States from 1833 to 1841, inclusive, distinguishing the values of teas; together with the number of vessels and the tonnage employed in the trade:

Years.	Number of Vessels.	Tonnage.	Values of Imports.	Values of Teas.
1833.....	41	15,394	\$7,541,570	\$5,484,693
1834.....	43	15,550	7,892,327	6,217,949
1835.....	36	13,495	5,987,187	4,552,806
1836.....	43	16,445	7,324,816	5,342,811
1837.....	42	16,160	8,965,337	5,903,054
1838.....	29	11,821	4,764,536	3,471,156
1839.....	18	7,392	3,678,509	2,428,419
1840.....	35	14,771	6,640,829	5,427,010
1841.....	28	11,486	3,695,368	3,466,247
Total.....	315	122,954	\$56,490,499	\$42,200,053

From the preceding table it may be seen that the value of teas reached annually, during the period designated, about \$4,698,894, and constituted 75 per cent. of the value of the entire imports; while the trade employed annually about thirty-five vessels, averaging 390 tons each. The preceding table is continued as follows, down to 1855, and exhibits generally the same proportion between the value of total imports from China into the United States and the value of teas:

Years.	Tonnage.	Values of Imports.	Values of Teas.
1842.....	12,488	\$4,934,645	\$4,367,101
1843.....	13,460	4,385,566	3,776,464
1844.....	15,399	4,931,255	4,075,191
1845.....	21,682	7,285,914	5,730,101
1846.....	19,243	6,593,881	5,022,600
1847.....	17,775	5,893,343	4,278,448
1848.....	24,383	8,083,496	6,217,111
1849.....	19,418	5,513,785	4,071,759
1850.....	29,414	6,593,462	4,585,720
1851.....	38,914	7,065,144	4,633,529
1852.....	78,085	10,593,950	7,144,500
1853.....	92,864	10,537,710	8,174,670
1854.....	70,426	10,506,329	6,545,115
1855.....	70,815	11,048,726	6,806,463

TEA EXPORTED FROM CHINA TO GREAT BRITAIN AND THE UNITED STATES, RESPECTIVELY, FOR A PERIOD OF TEN YEARS, ENDING JUNE 30, 1854. —(MADE UP FROM THE "CHINA MAIL.")

Years.	To Great Britain.	To United States.
	Pounds.	Pounds.
1845.....	53,570,200	20,762,558
1846.....	57,584,600	18,502,288
1847.....	53,365,000	18,171,625
1848.....	47,094,300	19,338,640
1849.....	47,242,700	18,672,300
1850.....	53,961,800	21,757,800
1851.....	64,020,100	28,760,800
1852.....	65,187,200	34,354,000
1853.....	72,906,100	40,974,500
1854.....	77,217,900	27,867,500

It will be noticed that these statistics agree with those given below, the latter being taken from the United States Treasury Reports.

TEA EXPORTED FROM CHINA TO GREAT BRITAIN, FRANCE, AND THE UNITED STATES, FROM 1821 TO 1840.—(FROM FRENCH AUTHORITIES.)

Years.	England.	France.	United States.	Total.
	Kilograms.	Kilograms.	Kilograms.	Kilograms.
1821.....	13,520,000	56,040	2,258,000	16,114,000

1830.....	14,554,000	9,000	3,863,000	18,226,000
1831.....	14,242,000	237,000	2,330,000	16,809,000
1832.....	14,269,000	47,000	4,452,000	19,768,000
1833.....	14,427,000	356,000	6,557,000	21,400,000
1834.....	14,415,000	648,000	7,319,000	22,380,000
1835.....	19,725,000	46,000	6,432,000	26,203,000
1836.....	21,800,000	116,000	7,361,000	29,277,000
1837.....	16,426,000	35,000	7,628,000	24,089,000
1838.....	18,187,000	124,000	6,485,000	24,796,000
1839.....	17,172,000	93,000	4,184,000	21,449,000
1840.....	12,610,000	264,000	9,063,000	21,937,000

In addition to the foregoing, large quantities of tea are exported from China to the Netherlands, Hanse Towns, the Levant, the Mediterranean, and Russia. To the last-named country there were exported in 1839, 3,442,000 kilograms; and in 1840, 3,585,000 kilograms; which, added to the totals for 1839, will give for that year 24,891,000 kilograms; and for 1840, 25,522,000 kilograms.

"In the consumption of tea, the United States rank next to Great Britain. From 1815 to 1834 there were exported to the former, for consumption and re-exportation, 35,805,000 kilograms. In 1832, 4,028,000 kilograms, of which 20,000 kilograms were re-exported. In 1833-'34 the Americans exported from Canton for Europe 1,044,000 kilograms. Consumption in the United States has largely increased since tea was put on the free list of that country."

The following is a statement of the exports of tea from China to the United States for ten years, from 1845 to 1854, inclusive:

Year ending June 30.	Green.	Black.	Total.
	Pounds.	Pounds.	Pounds.
1845.....	13,812,099	6,950,459	20,762,558
1846, in 40 vessels.....	14,236,082	4,216,168	18,502,248
1847, in 37 ".....	13,853,132	4,318,496	18,171,828
1848, in 38 ".....	15,346,030	3,993,617	19,338,647
1849, in 37 ".....	13,818,700	4,853,600	18,672,300
1850, in 44 ".....	14,396,400	7,361,400	21,757,800
1851, in 64 ".....	15,205,700	13,515,100	28,760,800
1852, in 63 ".....	20,937,300	13,396,700	34,334,000
1853, in 72 ".....	26,439,800	14,484,700	40,974,500
1854, in 47 ".....	18,280,300	9,397,200	27,667,500

For the year ending June 30, 1855, the total number of pounds exported to the United States was 31,515,900, in forty-eight vessels, distributed among three ports, as follows:

	Pounds.
Canton.....	2,561,900
Foo-chow.....	5,400,800
Shanghai.....	23,553,200
Total, year 1854-'55.....	31,515,900

5 Z

For the year ending June 30, 1856, it was 40,247,800 pounds, in fifty-eight vessels, distributed as follows:

	Pounds.
Canton.....	8,240,800
Foo-chow.....	10,873,900
Shanghai.....	21,127,100
Total, year 1855-'56.....	40,247,800

From July 1, 1856, to January 15, 1857, the exports to this country were 16,299,600 pounds.

	Pounds.
From Canton.....	997,500
From Foo-chow.....	5,857,200
From Shanghai.....	9,444,900
Total, 64 months.....	16,299,600

The exports to Great Britain during the year 1855-'56 were 91,931,800 pounds; and from July 1, 1856, to January 15, 1857, 39,991,400 pounds.

Total.....	20,325,541	\$5,757,860

In England there are certain ports where teas may be imported. There are warehouses which may be approved of for the deposit of teas, and are to be exclusively appropriated to that purpose. No package shall be divided into smaller packages, except for the purpose of stores, nor shall the mixing of tea of any sort or sorts be permitted in the warehouses, either for home consumption or exportation. The packages shall be sorted and arranged in the warehouse by the occupier, according to their respective "chops" or "beds," so as to enable the officers to select from each the required number of packages for taring, and to ascertain the proper tare to be allowed on the package therein.

Duty on Teas.—Tea or coffee, shipped from the country of production, but not for a distinct and specific destination to persons or places in the United States, and transhipped at a foreign intermediate port for the United States, is, on importation, liable to a duty of 20 per cent. But if originally shipped in national vessels, or vessels placed on that footing by treaty, for a specific party and place in the United States, from the country of production, and so imported into the United States, these articles are entitled to free entry, although a mere transhipment may have taken place at a foreign intermediate port.

Tea or coffee, entitled to free entry when originally imported into the United States, afterward exported to a foreign port and brought back as part of the returning cargo of the exporting vessel, not having been landed abroad, is entitled to free entry on its reimportation under these circumstances. Tea and coffee, when imported direct from the place of their growth or production in American vessels, or in foreign vessels so entitled by reciprocal treaties, are exempt from duty.

Coffee, the product of a possession of the Netherlands, imported into the United States in a vessel of the Netherlands direct from such possessions, or from the Netherlands, is admitted free of duty under the tariff law of 1846, and the first article of the treaty between the United States and the Netherlands of August 26, 1852. Tea or coffee imported direct from the place of its production, in vessels of the kingdom of Prussia, and of the Hanseatic republics of Hamburg, Bremen, and Lübeck, is placed on the same footing with that imported in American or Dutch vessels.

Tea or coffee, the production of China, imported via Singapore, is admitted to free entry, if it be satisfactorily shown at the time of entry that it was laden on board the American importing vessel from Chinese boats or junks in Chinese waters, intended in good

faith to be conveyed therein direct to a specified port of the United States, as its ultimate destination.

Teak Wood, or Indian Oak, the produce of the *Tectona grandis*, a large forest tree that grows in dry and elevated districts in the south of India, the Burman empire, Pegu, Ava, Siam, Java, etc. Teak timber is by far the best in the East; it works easily, and, though porous, is strong and durable; it is easily seasoned, and shrinks very little; it is of an oily nature, and therefore does not injure iron. Mr. Crawford says that in comparing teak and oak together, the useful qualities of the former will be found to preponderate. "It is equally strong, and somewhat more buoyant. Its durability is more uniform and decided; and to insure that durability it demands less care and preparation; for it may be put in use almost green from the forest, without danger of dry or wet rot. It is fit to endure all climates and alternations of climate."—See TREGOLD'S *Principles of Carpentry*; CRAWFORD'S *Eastern Archipelago*; REES' *Cyclopædia*. The teak of Malabar, produced on the high table-land of the south of India, is deemed the best of any. It is the closest in its fibre, and contains the largest quantity of oil, being at once the heaviest and the most durable. This species of teak is used for the keel, timbers, and such parts of a ship as are under water; owing to its great weight, it is less suitable for the upper works, and is not at all fit for spars. The teak of Java ranks next to that of Malabar, and is especially suitable for planking. The Rangoon or Burman teak, and that of Siam, is not so close-grained or durable as the others. It is, however, the most buoyant, and is therefore best fitted for masts and spars. Malabar teak is extensively used in the building-yards of Bombay. Ships built wholly of it are almost indestructible by ordinary wear and tear, and instances are not rare of their having lasted from 80 to 100 years. They are said to sail indifferently, but this is probably owing as much to some defect in their construction as to the weight of the timber. Calcutta ships are never wholly built of teak; the timbers and frame-work are always of native wood, and the planking and deck only of teak. The teak of Burma, being conveyed with comparatively little difficulty to the ports of Rangoon and Maulmain, is the cheapest and most abundant of any; and it is mainly owing to the facility with which supplies of it are obtained that ship-building is now carried on so very extensively at Maulmain. It is largely exported to Calcutta and Madras.—See RANGOON. A species of timber called African teak is exported from the west coast of Africa; but in point of fact it is not teak, and it is destitute of several of its most valuable properties. It is, however, for some purposes, a useful species of timber.

Teasel, or Fullers' Thistle (Ger. *Weberdistel*, *Kratzdistel*; Fr. *Chardon à carder*; It. *Cardo da cardare*; Sp. *Cardencha*, *Cardo peinador*). This plant, which is cultivated in the north and west of England, is an article of considerable importance to clothiers, who employ the crooked awns of the heads for raising the nap on woolen cloths. For this purpose they are fixed round the periphery of a large, broad wheel, against which the cloth is held while the machine is turned. In choosing teasels, the preference should be given to those with the largest bur, and most pointed, which are generally called *male teasels*. They are mostly used in preparing and dressing stockings and coverlets; the smaller kind, commonly called the fullers' or drapers', and sometimes the *female teasels*, are used in the preparation of the finer stuffs, as cloths, ratens, etc.

Tehuantepec, Gulf of, a bay of the Pacific Ocean, Central America, bounded northwest by the state of Oaxaca, and northeast by the republic of Guatemala, lat. 16° N., long. 94° to 95° W. It receives the River Tehuantepec 10 miles south of the town.

The *Isthmus of Tehuantepec*, states of Oaxaca, Vera Cruz, and Tabasco, is the narrowest part of the land

separating the Gulf of Mexico from the Pacific, and is 130 miles across. It produces mahogany, fustic, logwood, cotton, drugs, cacao, indigo, gum, salt, with various kinds of grain; and its uplands abound with fine pastures. It is traversed almost throughout by the River Coatzacoalcas. This is one of the places where it has been proposed to unite the Atlantic and Pacific oceans by a canal, of which the river and some lakes would form a part.

This new inter-oceanic route is by the River Coatzacoalcas to Suchil, something over 100 miles from the sea, all the windings included, thence overland by stage to Ventosa, 130 to 140 miles; making in all about 240 miles from the Atlantic to the Pacific, to be accomplished in a day and a half from the sea. This distance will be materially diminished—the time still more so—on completion of a projected railroad from Minatitlan to Suchil, already surveyed.

From the mouth of the river to Minatitlan, twenty miles, the channel is excellent, capacious enough for the largest ocean steamships. The depth of water on the bar at low tide is 15 to 16 feet (Major Barnard says 13), and only one obstruction, a large rock, has been discovered, and that easily avoidable. From Minatitlan to Suchil the river becomes more difficult, and must be traversed by steamboats; those contemplated are, in size and fashion, not dissimilar from the Cumberland River boats. The *Leonora*, built in New York, and placed on this portion of the river a short time since, had proved of too large draught. The current is about two miles and a half an hour—from Suchil to Minatitlan, thirty-six hours. These are the termini of the projected railway, by which, when completed, a distance of 45 miles will be saved.

From Suchil to Ventosa, on the Pacific, 130 to 140 miles, the route is by the newly-made stage-road over a rough, sometimes mountainous country. The heaviest work has been on this end of the road, where also the River Puerta, fordable at times, but high and marshy in the rainy season, is to be spanned by a bridge a mile and a half in length. Some compensation is made on the other side of the mountain, however, by an old road, which has proved available from Chivela Pass to the Pacific plain. The time contracted for on the stage-road is five miles per hour—twenty-six to twenty-eight hours; between Minatitlan and Suchil the passage by steamboat will be from six to eight hours, in all about thirty-five hours, or a day and a half from ocean to ocean. The harbor of Ventosa is good, but a breakwater will be necessary. As to the probable amount of travel and business on the Tehuantepec road, when in full operation, we have no further information than is already, in various speculations, before the public. The shortest route from England, New York, and New Orleans, to the ports of the Pacific, the most flattering expectations are of course entertained respecting it.

The present population of the territory of Tehuantepec is estimated at 50,000, descendants, for the most part, of the original Aztecs. They are gregarious in their habits, living in communities numbering 3000 to 4000 each, and distant from each other five to ten miles. They are industrious, kind-hearted, and docile, but very thriftless. The government is, of course, that which at any time our *mobile* Mexican neighbors may chance to have. In general, the rights and privileges of the old Spanish colonial towns are fully enjoyed. Titles to landed property are good, and always respected. The town of Minatitlan, the capital and emporium of the territory, has at present a population of about five hundred. The commerce in the native products of the country, mahogany, dyewoods, coffee, etc., is large and increasing. The last quarter Mr. P. cleared twelve American vessels, averaging 200 tons each, and the foreign export business was about the same. The government, a short time since, appropriated the handsome sum of \$50,000 for the erec-

tion of a new custom-house, the foundation of which is already laid. On the whole, what with present business and future expectations, our Tehuantepec neighbors are evidently looking up.—*United States Consul at Minatitlan.*

Tehuantepec Route.—The following figures show the distances on the Tehuantepec route from New York to San Francisco:

	Miles.

Ventosa to San Francisco	2804
Total	4815

Telegraph. Long before the electric telegraph had been imagined, the art of rapidly conveying intelligence from point to point had occupied the attention of mankind, and various expedients for the accomplishment of this object had been devised. The most primitive modes of telegraphing were by means of signal-fires, torches, trumpets. More recently, since the invention of gunpowder, the cannon and sky-rockets have been used. On the invention of the aerial telegraph, or semaphore, these means were abandoned.

In the year 1684 Dr. Hooke described a plan for an aerial telegraph, and about 1704 M. Amontons instituted experiments with the same end in view. However, neither of these plans were carried into effect; and it was not until 1794 that the semaphore was actually used. In that year an aerial telegraph, the invention of M. Claude Chappé, was employed for the transmission of intelligence between Paris and Lille; the conveyance of a signal from one of these places to the other occupying only two minutes. Semaphores, mostly modifications of the plan of Chappé, were soon in use throughout Europe—in England, in 1795; Denmark, in 1802; India, in 1823; Prussia and Austria, about 1833; and Russia, in 1839.

This method of telegraphing is still in use, but is rapidly being superseded by the electric telegraph. In 1852 the only aerial telegraph line in England was between Liverpool and Holyhead. This has now, we believe, been superseded by the establishment of electric communication between those two places.

The cost of working the aerial telegraph was enormous. The line above mentioned cost in the vicinity of £1500 (about \$7500) per annum; and a similar line, between London and Portsmouth, cost £3300 (about \$16,500) per annum.

These telegraphs were necessarily imperfect; being limited in their power of conveying intelligence, exceedingly slow, and liable to total interruption by storms of rain and snow, fogs and darkness.

The idea of the employment of electricity as a means of conveying intelligence to a distance appears to have been long entertained, and experiments to ascertain the practicability of electrical communication between distant places were early made by scientific men throughout the civilized world. In 1729 Grey and Wheeler discovered that a current of electricity could be made to flow through considerable lengths of wire. In 1746 Winckler at Leipsic, and Le Monnier at Paris, experimented on the same subject of the transmission of the electric current through conducting bodies. In 1747 Dr. Watson, in England, repeated and extended these experiments, sending a current through two miles of wire and two of earth; sending shocks across the Thames and the New River. Dr. Franklin in 1748, and De Luc in 1749, repeated many of these experiments. In addition, experiments bearing more or less on the subject of electric telegraphy were made by Lesage in 1774, Reusser in 1794, Cavallo in 1795, Betancourt in 1798, Söenmering in 1807, and Prof. Oersted in 1819.

The first electric telegraph actually applied seems to have been the invention of M. D. F. Salva. Humboldt says his telegraph was established between Madrid and Aranjuez in 1798—a distance of about 26 miles.

In 1816 Francis Ronalds, of Hammersmith, England, constructed a telegraph of eight miles in length. This

telegraph was one of the best that had then been invented, and was capable of transmitting intelligence with considerable rapidity. In 1823 he urged the importance of his invention for government purposes, writing to Lord Melville on the subject, but without effect.

In 1827 Harrison G. Dyer, an American, constructed a telegraph on Long Island, using frictional electricity. The line was about two miles in length.

Previous to 1809 no mode of electric telegraphing capable of any extended use had been discovered. The principal cause of failure seems to have been in the employment of frictional electricity, which is, on account of its high intensity, confined with great difficulty to conducting bodies, rapid and incontinuous in its action, and, from its small quantity, devoid of energetic force.

Sömmering made a step forward by his application of galvanism to the purposes of telegraphing. In 1809 he constructed, at Munich, a telegraphic apparatus, using 35 wires. The signals were made by the decomposition of water in 35 tubes, which were in connection with the 35 wires of the line. Telegraphs employing the pure galvanic force were also invented by Schweigger, De Haer, R. Smith (Scotland, about 1843); Bain, 1846; and Morse, 1849.

Bain's was the only telegraph on this principle that was extensively used. He used a very simple apparatus, receiving the galvanic current upon chemically-prepared paper, where it made a light-blue mark. A combination of dots constituted his alphabet. This telegraph was exceedingly rapid, being capable of transmitting 1200 letters per minute. In 1850 about 200 miles of telegraph in England, and 1500 in America, were worked under Bain's patents. His plan has gone now almost entirely out of use, other and better instruments superseding it.

The property which lightning possesses of reversing or destroying the poles of the natural magnet, and of imparting magnetism to iron, had long been known; but not until 1820 was the fact turned to any useful purpose. Professor Oersted, of Copenhagen, discovered, during 1819, that if a wire charged with electricity is placed parallel to a magnetic needle, the needle will deviate from its natural position, tending to assume a position at right angles with the conducting wire; and that this deviation follows a regular law. Proceeding on the groundwork of Professor Oersted, many other discoveries were made by Arago, Ampère, Faraday, Davy, Sturgeon, and Professor Henry.

Arago and Ampère in France, and Sir H. Davy in England, discovered that a current of electricity would render steel magnetic; and Ampère found that by coiling the wire in the form of a helix round steel the effect was greatly increased. William Sturgeon, of London, in the year 1825, discovered and constructed the electro-magnet. The electro-magnet is one of the most valuable parts of the electric telegraph now in use, and has entered more or less into nearly every telegraph invented since its discovery.

Oersted's great discovery gave a new direction to the science of electric telegraphing. Galvanic telegraphs were, in turn, discarded, and magneto-electric telegraphs took their place.

Ampère was the first to make use of Oersted's discovery in telegraphing. In 1820 he invented a telegraph, using 36 magnetic needles. His plan was not practically carried into effect.

Baron de Schilling invented a needle telegraph in 1832, at St. Petersburg. His instrument had five needles, which, by their vibrations to the right or left, indicated signals. He afterward improved his instrument, using but one needle.

In 1837 Dr. Steinheil had a telegraphic instrument working a distance of 12 miles. His telegraph of one wire, and either one or two magnetic needles, as might be desired, made permanent marks on paper, and also telegraphed by sound. When writing, his needles were

furnished with ink-tubes, and by their motions marks were recorded on paper; when telegraphing by sound, the needles were made to strike bells of different tones. He used the earth as part of the circuit. This was very nearly a perfect instrument, and is infinitely superior to the majority of telegraphic instruments since invented.

June 12, 1837, Messrs. Cooke & Wheatstone, in England, obtained a patent for "improvements in giving signals and sounding alarms in distant places, by means of electric currents transmitted through metallic circuits." This seems to have been the first telegraph that was patented in Europe. Cooke & Wheatstone's first telegraph was a needle telegraph. They used five magnetic needles and five wires. An electro-magnet was used to sound an alarm. A second patent, taken out by Cooke only, was issued in April, 1838. These instruments were found to be very imperfect, and after a short trial were abandoned.

A different form of telegraph, the invention of the same parties, having but two needles, has, until very recently, been in general use in England; but the Morse system is now being adopted there and upon the Continent.

The last patent taken out by Cooke & Wheatstone is dated May 6, 1845. During the same year an act of Parliament was obtained incorporating "The Electric Telegraph Company," working these patents.

The needle telegraph is, comparatively, very slow; the average speed per message being but 14 words per minute. It is, however, yet extensively used in England. Cooke & Wheatstone took out a patent in America, but their instrument was never practically used in the United States.

Since Cooke & Wheatstone's first patent, upward of 40 patents have been taken out in England alone. Very few of the instruments since invented are in practical operation.

Morse's Telegraph.—In the year 1832 Professor S. F. B. Morse first conceived the idea of an electric telegraph; and in the year 1835 he had a telegraph constructed, the basis of his present simple and beautiful instrument. In September, 1837, he exhibited his instrument at the New York University, working through 1700 feet of wire.

Morse applied for a patent in the United States in April, 1838. This application was afterward withdrawn, and his patent was not taken out until June, 1840. In 1842 he petitioned Congress, who appropriated \$30,000 to his use for the construction of a line between Washington and Baltimore. In June, 1844, Morse had his invention in successful operation between Washington and Baltimore—a distance of 40 miles. This was the only line in the United States constructed under government patronage.

The Morse Electro-magnetic Telegraph consists mainly of two parts—the receiving magnet and the registering apparatus. The receiving magnet is surrounded by fine wire, and is of the horseshoe form. An adjustable armature is placed before the poles of the receiving magnet. The main circuit passes unbroken through the receiving magnet to the next station.

The registering apparatus has a powerful horse-shoe magnet placed vertically. Above the poles of the magnet is an armature attached to one end of a movable lever, on the other end of which is a steel style for the purpose of impressing marks on paper placed immediately above the style. Intelligence is transmitted by means of breaking and closing the main circuit. For this purpose a small key is employed. When this key is pressed down, the current passes to the receiving magnet of the distant station, causing the receiving magnet to close the local circuit. On the local circuit being closed, the registering magnet becomes excited and attracts the armature downward, causing a mark on the paper, placed above the lever of

the armature. On the circuit being opened again by the operator's raising the key, all returns to its usual quiescent position. This operation is performed at every closing and breaking of the circuit. By keeping the key depressed for an instant, a dot is made; if it is depressed for a longer time, a line. A combination of dots and lines forms the telegraphic alphabet used with this system. The speed of this instrument is, in the hands of an expert, about twenty words per minute.

Professor Morse's instrument was for some time the only instrument in use in this country, and is now used to a greater extent than all other telegraphs combined.

The House Telegraph, the invention of Royal E. House, differs materially from all previously invented telegraphic instruments, printing messages in the ordinary Roman letters. Directly under a set of keys like those of the piano-forte is a shaft inclosed by a cylinder. This shaft is made to revolve rapidly by means of a treadle. The shaft and cylinder are so arranged that the cylinder can be arrested while the shaft still revolves. On one end of this cylinder is a brass wheel having fourteen teeth. A spring is so arranged, that when the shaft and cylinder revolve it will alternately strike a tooth of this brass wheel and pass into an open space; thus alternately breaking and closing the electric circuit. On the cylinder two lines of teeth project, fourteen in each line, one for each tooth and each space of the circuit wheel. These teeth are immediately below the keys, so that by pressing down a key the motion of the cylinder is stopped. By making the cylinder revolve, the circuit is rapidly broken and closed, which continues till a key is depressed. On the key being released, the revolution goes on as before. The electrical pulsations produced by the breaking and closing of the circuit are conveyed to the magnet of the distant instrument, each pulsation causing the magnet to act.

The type-wheel, a wheel having the letters of the alphabet cut upon it, is made to revolve, but is so checked by an escapement wheel that only one letter goes forward at a time. This escapement is connected by a lever with the piston of an air-chamber. This piston is caused to move horizontally backward and forward, by means of compressed air admitted alternately on different sides of the piston. A valve attached to the magnet regulates the pressure of the air on the piston. Every breaking and closing of the circuit causes the magnet, piston, and escape to act, so that for every time the circuit is broken or closed the type-wheel is advanced one letter. If any letter of the type-wheel is placed in a certain position, and the key corresponding to it is depressed, raised, and again depressed, the circuit wheel at the transmitting station and the type-wheel at the receiving station make one revolution, bringing the letter back to its former position. Any other letter is brought into the required position by pressing down its key on the keyboard of the instrument. The letter first brought into position is the dash. The type-wheel is stopped at the dash, after which the printing goes regularly on as the keys are depressed. Immediately before the type-wheel is the press, containing a narrow strip of paper. At the depression of a key the type-wheel stops, sets a crank in motion, which presses the paper forcibly against the letter opposite to it on the type-wheel. On the key being raised, the type-wheel revolves until the depression of another key, which again unlocks the press and prints a letter.

The electric current is used in this instrument to preserve equal time, that the letters in one machine may correspond to those in the other. The number of pulsations required to indicate a succession of letters is exceedingly unequal; from *a* to *b* requires one, from *A* to *A* twenty-eight pulsations.

House obtained a second patent in December, 1852. The House instrument is used to a limited extent in

this country. It is still less used in England, where it is known as Jacob Brett's Telegraph. This instrument is more rapid than Morse's, printing accurately from twenty-five to thirty words per minute.

The Hughes Telegraph is the invention of David E. Hughes, of Kentucky, who obtained a patent in 1855 and in 1858. This, like the House Telegraph, is a printing telegraph, but in principle and in mechanism it is totally unlike that instrument.

The Hughes system of telegraphing combines not only all the advantages of all other existing systems, but reduces the labor which electricity has to perform to the lowest possible point. In all other systems it requires several distinct electrical impulses to form a single letter. In the House system, which is based upon the number of waves sent, the average number of impulses required to determine the intended letter is seven: in the Morse system, which is based upon the number and duration of the waves sent, the average is three and a half. To print a letter every closing or breaking of the circuit, so that every electrical impulse should determine a letter, has long been a desideratum, more particularly since the discovery that it requires an appreciable time to charge a long wire with electricity; so that on long circuits we should be obliged to send a less number of electrical waves in a given time than on a short circuit. On submerged cables this and other effects are still more marked, reducing the speed of transmission upward of two-thirds. If every wave, instead of every three waves, produced a letter, it is evident enough that the speed of transmission through the cable would be equal to that of the air-lines with the systems now in use, and that the speed of the air-lines would be increased two-thirds. The Hughes system uses but one electrical impulse per letter, and by the use of a new and exceedingly sensitive magnet can work on lines of far greater length, and with a rapidity exceeding that of any telegraph now in existence.

To carry out the one-wave system, it is essential that the type-wheels of the different instruments should revolve at precisely the same speed, so that the same letter on each type-wheel should be opposite a given point at the same time. Clock-work governed by means of a pendulum would be too slow for any practical use. Instead of a pendulum, Hughes employs as a governor a vibrating spring. This spring allows the type-wheels to revolve with any desired degree of rapidity. This governor is dependent for its correct action on a law of acoustics, viz., "that a certain number of vibrations per second produces a certain musical tone; and if there are two or more springs of the same tone, they invariably give the same number of vibrations per second." If these springs by their vibrations are made to unlock an escapement, it follows that all instruments governed by springs of the same tone must revolve in exactly the same time. The type-wheels, thus governed, revolve at the rate of 100 revolutions per minute, and the average number of letters sent at each revolution being two, it follows that the speed of the instrument is 200 letters per minute, equal to about forty words.

This is about the speed that an ordinary operator touches the keys, but not by any means the utmost speed of the instrument, as the type-wheels would revolve with undeviating accuracy at a speed of 500 instead of 100 revolutions per minute.

The magnet of the Hughes instrument, which receives the electric current from the distant station, is a combination of a natural and an electro-magnet. The attractive power of the natural magnet, exerted through the electro-magnet, holds a small armature in contact with the poles of the electro-magnet. A spring attached to the armature is so adjusted as nearly to pull the armature away from the poles of the electro-magnet. The slightest change in polarity causes the spring to pull the armature away from its resting-

place. The armature is restored to its place by means of a lever, which acts upon it at the instant it is pulled away from the electro-magnet's poles. This arrangement employs the current of electricity merely to effect a slight change in the force by which the armature is held to the magnet's poles, and it is so remarkably sensitive that the mere contact of a piece of zinc against a copper wire has been found amply sufficient to work the magnet. From its sensitiveness it requires scarcely a tenth of the battery-power used by the most sensitive of other systems.

Another wonderful and beautiful feature of this instrument is its power of writing both ways, sending and receiving messages at the same instant over one wire. This instrument thus doubles the capacity of the wire, making it do the service of two; transmitting with certainty and accuracy 200 letters each way per minute, an actual transmission of 400 letters, or 80 words, per minute. This result is accomplished by means of a peculiar arrangement of the batteries and magnets, so that the current from the transmitting station does not influence its own magnet, while it affects that of the receiving station, each magnet thus being placed under control of the distant operator.

The machinery which accomplishes results so astonishing is simple in the extreme. It consists mainly of four clock-wheels used to turn the type-wheel. These wheels are governed by the vibrating spring before explained. At the moment a current from the distant station enters the magnet the armature flies off, opens a detent which causes a small press to be locked to the wheel-work of the instrument, and then to press a strip of paper against the letter of the type-wheel opposite the press at that instant. A current is sent upon the line by means of keys arranged like those of a piano, and having the letters of the alphabet engraved upon them. At the moment one of these keys is depressed the magnet of the receiving station is made to act, and the press to print the letter corresponding to the touched key. The receiving operator has nothing to do but to tear off the messages as they arrive.

This instrument, after more than ten years of persevering thought and labor, is at last perfected, and now fulfills all the requisites of a perfect telegraph instrument—more than realizing all that has ever been claimed for it by the inventor. The remarkable ingenuity, talent, and knowledge of the principles of electrical science displayed by Professor Hughes, in the invention of his beautiful machine, deservedly place him foremost in the ranks of the laborers in this branch of art, and justify his claim of having invented a telegraph instrument which, for speed, neatness, and economy, is without a rival.

The numerous advantages that the Hughes instrument possesses over all other existing systems, particularly in the matter of speed and power of working on long circuits, will probably give it the preference in the selection of telegraphic machines with which to work the Atlantic Submarine cable. Indeed it may well be doubted if any other system can be made practically available for that purpose.

The following brief summary of the telegraph lines of the world at the close of the year 1857 will furnish some idea of the importance of the telegraphic art, and of its claims to public attention:

United States have upward of 35,000 miles of telegraph, employing a capital, as near as can be ascertained, of \$4,000,000. The instruments used are the Hughes, House, and Morse machines.

British Provinces have 5000 miles of telegraph, employing a capital of \$500,000.

Cuba and Mexico have short and unreliable lines, which are controlled by the governments.

England has about 10,000 miles of telegraph lines—upward of 40,000 miles of conducting wire—employing a capital estimated at a million and a half pounds sterling. In England the government has the power of ordering all government messages to take precedence of any other communications,

and when deemed necessary all telegraphs are required to be placed at the sole disposal of the government. Only one instance of this kind has occurred; on the occasion of the anticipated Chartist riots in April, 1849.

France has 8000 miles of telegraph in operation, under the exclusive control of the government.

Belgium has about 550 miles of telegraph lines, constructed and controlled by the government.

Germany and Austria have nearly 10,000 miles of telegraph, controlled by the governments.

Prussia has about 4000 miles of telegraph in operation. The wires are mostly underground—controlled by the government.

Holland has 600 miles of telegraph.

Saxony and Bavaria have government lines of about 1700 miles.

Italy has 2500 miles, controlled by its different governments.

Switzerland has 1500 miles, under control of the Federal government.

Spain and Portugal have some 800 miles—controlled by the governments.

Russia.—Of the number and extent of Russian telegraph lines little is known. As near as can be estimated, they extend over 5000 miles—under government control.

India has now in operation 5000 miles of telegraph, constructed and controlled by the East India Company.

Australia has 500 miles in operation, and 800 miles nearly or quite completed.

RECAPITULATION.

	Miles.
America	45,000
England	10,000
France	8,000
Germany and Austria.....	10,000
Prussia	4,000
Russia	5,000
Rest of Europe	7,650
India.....	5,000
Australia	1,200
Other parts of the world	500
Total length of telegraph lines...	95,350

The number of messages passing over all lines in the United States is estimated at about 4,000,000 per annum.

In addition to the land lines, numerous submarine cables have been laid in different parts of the world. Annexed is a brief account of the different submarine cables, lengths, when laid, etc.

The first submarine cable was laid between Dover, England, and Calais, France, during August, 1850. This cable was about 24 miles in length. Electrical communication between England and France continued uninterrupted for about a month, when the cable was broken. Upon examination it was found that the chafing of the cable against rocks off Cape Grienez had caused it to part. A second cable was immediately relaid, larger and stronger than its predecessor, which has remained in good working order up to the present time.

In May, 1852, a submarine cable was successfully laid between Holyhead and Howth, thus connecting England with Ireland. This cable is 64 miles in length.

During May, 1853, "the Port Patrick and Carrickfergus" cable, 24 miles in length, connecting Scotland and Ireland, was laid.

In June, 1854, a cable 115 miles in length was laid between Orfordness, England, and the Hague, Holland.

A third cable, 75 miles in length, was laid in 1852, between Dover and Ostend.

In 1854 cables from Italy to Corsica, thence to Sardinia, were, after much difficulty, successfully laid down, a distance of about 75 miles.

The New York, Newfoundland, and London Telegraph Company, in 1855 made an attempt to connect the islands of Newfoundland and Cape Breton. The attempt was unsuccessful. In 1856 another attempt was made, resulting in complete success.

Summary of Submarine Cables.—The following is a correct table of the number and length of the submarine cables laid down in different parts of the world:

By the act of February, 1857, "all former acts authorizing the currency of foreign gold and silver coins, and declaring the same a legal tender in payment of debts, are hereby repealed."

In the absence of any special agreement, the only payment known to the law is by cash. The tender should properly be in cash, and must be so, if that is required. A tender of a larger sum than is due, with a requirement of change or of the balance, is not good. A lawful tender, and payment of the money into court, is a good defense to an action for the debt. But the creditor may break down this defense by proving that he demanded the money of the debtor, and the debtor refused to give it, subsequently to the tender.—*PARSONS on Mercantile Law.*

Teneriffe, the largest island of the group called the Canaries, lies between Canary and Gomera. It is of an irregular shape, 60 miles in length, with an extreme breadth of 30 miles. Not more than one-seventh is cultivable. A chain of mountains traverses the island in the direction of its greatest length, and in the middle of the broadest part rises the celebrated peak locally known as the Pico de Teyde, which, with its supports and spurs, occupies nearly two-thirds of the whole island.

The Canary Islands are in the North Atlantic Ocean, between lat. 27° 40' and 29° 30' N., and long. 13° 30' and 18° 20' W. The names of the seven principal

islands, their respective area in English square miles, and their population in 1835, are given in the following table:

Islands.	Area.	Population.
Teneriffe.....	877	85,000
Grand Canary.....	758	68,000
Palma.....	718	33,000
Lanzarote.....	323	17,400
Fuerteventura.....	326	13,800
Gomera.....	169	11,700
Hierro.....	83	4,400

Formerly the total annual produce was estimated at about 40,000 pipes, of which 25,000 pipes were produced in Teneriffe. Between 8000 and 9000 pipes were exported. The chief exports are wine, cochineal, barilla, and orchilla. The imports consist of woolen, silk, cotton, and iron manufactures, glass, etc.

Principal Ports.—The ports of Santa Cruz de Teneriffe, Orotana, Ciudad Real de los Palmas, Anciciffe de Langarole, Puerto de Cabras, and San Sebastian, in the Canary Islands, having been declared free by royal decree proclaimed on the 10th of October, 1852, and vessels of the United States and their cargoes arriving in said ports being thus placed on the same footing with those of Spain, no discriminating duty is levied on Spanish vessels and their cargoes arriving from those ports in the ports of the United States; provided that on every such arrival the required consular certificate be filed with the collector of the port.—*See CANARIES.*

COMMERCE OF THE UNITED STATES WITH TENERIFFE AND THE CANARIES, FROM OCTOBER 1, 1820, TO JULY 1, 1857.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Tennessee, one of the United States, lies between lat. 35° and 36° 30' N., and long. 81° 30' and 90° 10' W. Its mean length is 400 miles, and its mean breadth 114 miles, containing 44,000 square miles. Population in 1790 was 35,691; in 1800, 105,602; in 1810, 261,727; in 1820, 422,818; in 1830, 681,904; in 1840, 829,210; and in 1850, 1,002,625. The soil is various, but generally fertile. The western part has a dark rich soil; in the middle are great quantities of excellent land. In

the eastern part the mountains are mostly sterile, but the valleys are very fertile. The country has a great profusion of native timber, poplar, hickory, walnut, oak, beach, sycamore, locust, cherry, sugar-maple, etc. There are many medicinal plants. The soil produces abundantly cotton and tobacco, the staple commodities of the State; also grain, grass, and fruit. The eastern portion of the State contains the principal mineral deposits, among which are ores of iron, copper, lead, and beds

of coal. Mineral springs occur; granite and limestone abound. In the latter formation are many caverns of great extent; some have been explored for miles. There were in this State in 1850, 5,175,173 acres of land improved, and 13,808,849 unimproved land in farms. Cash value of farms, \$97,851,212; and the value of implements and machinery, \$5,360,210. *Live Stock*.—Horses, 270,636; asses and mules, 75,303; milch cows, 250,456; working oxen, 86,255; other cattle, 414,051; sheep, 811,591; swine, 3,104,800; value of live stock, \$29,978,016.

Agricultural Products, etc.—Wheat, 1,619,386 bushels; rye, 89,137; Indian corn, 52,276,228; oats, 7,703,086; barley, 2737; buckwheat, 19,427; peas and beans, 369,321; potatoes, 1,067,844; sweet potatoes, 2,777,716; rice, 258,854 lbs.; value of products of the orchard, \$52,894; produce of market gardens, \$97,183; pounds of butter made, 3,139,585; of cheese, 177,681; sugar, 248 hhds.; maple-sugar, 158,557 lbs.; molasses, 7223 gallons; beeswax and honey, 1,036,572 lbs.; wool, 1,364,378 lbs. produced; cotton, 194,532; flax, 368,131; silk cocoons, 1923; hops, 1032; tobacco, 20,148,932 lbs.; hay, 74,091 tons; hemp, 597 tons; clover-seeds, 5096 bushels; other grass seeds, 9118; flax-seed, 18,904; and were made, 92 gallons of wine; value of home-made manufactures, \$3,137,000; and of slaughtered animals, \$6,401,000.

The Tennessee River has its chief source in this State; it is 1250 miles long, and is navigable for steamboats to Florence in Alabama, 276 miles above its entrance into the Ohio, and from the head of the Muscle Shoals for boats 250 miles farther. Cumberland River, which, rising in Kentucky, runs mainly in Tennessee, is navigable for steamboats 198 miles to Nashville, and for boats 300 farther. It enters the Ohio River in Kentucky, 60 miles from the Mississippi River. The Holston, Clinch, French, Broad, and Hiwassee, are branches of the Tennessee; Obion, Forked Deer, and Wolf rivers, in the western part of the State, flow into the Mississippi, and are navigable for boats.

Manufactures, etc.—There were in the State in 1850, 33 cotton factories, with a capital invested of \$669,600, employing 310 males and 581 females, producing 363,250 yards of sheeting, etc., and 2,326,250 lbs. of yarn, valued at \$510,624; four woolen factories, with a capital of \$10,900, employing fifteen males and two females, manufacturing articles valued at \$6310; 23 establishments making pig-iron, with a capital of \$1,021,400, employing 1822 persons, producing 30,420 tons of pig-iron, etc., valued at \$676,100; 16 establishments with a capital of \$139,500, employing 269 persons, and making 3384 tons of castings, etc., valued at \$264,325; 42 establishments with a capital of \$755,050, employing 786 persons, manufacturing 10,348 tons of wrought iron, etc., valued at \$670,618. Capital invested in manufactures, \$7,044,144; value of manufactured articles, \$9,443,701. There were in this State in 1857, 51 banks and branches, with an aggregate cash capital of \$10,576,000; and in January, 1856, 15 railroads, with 455 miles of road completed and in operation.

Teredo, or Ship Worm. The following account of this worm is from a paper written by James Jarvis, who has been engaged since 1849 in a series of experiments concerning the teredo or ship worm, by order of Commodore Smith, chief of the Bureau of Yards and Docks. In order to ascertain the best composition for resisting the attacks of the teredo upon wood, he painted a number of blocks and boxes with various compounds—some he left unprepared, and some partly painted—and sunk them in Elizabeth River in the month of April. "About the 12th June the blocks and boxes were generally lifted and examined, but he never was able to discover any of the animalcule (young teredo) until about the 20th of June. At this period of the year he generally discovered minute holes in the wood by the use of a magnifying glass. After this the creature daily grows ahead, for it has no powers

of locomotion; it grows like an oyster, and has a calcareous or shelly sheathing, which adheres to the surface of its burrow."

In Norfolk harbor, Virginia, they grow from six to twelve inches in length, and from three-eighths to half an inch in diameter. The wood excavated by one twelve inches long, in a season, amounted to more than a cubic inch, if in a solid piece. No signs of the teredo were discovered by him in wood deposited after. Mr. Jarvis supposes that the teredo commences to develop about the 1st of July, and continues until cold weather arrives; in Charleston, South Carolina, and further south, they develop during the whole year; whereas in the colder blasts, such as in the harbors of New England, they do but little injury, because the worm is feeble there, being like a fine thread. It is believed to be a native of the torrid seas. The teredo is not so destructive on piles sunk under water at New York city docks as those on the opposite side of the river, on the Jersey and Long Island shores; this is owing, Mr. Jarvis thinks, to the amount of filth carried down in the city sewers. In Boston, and Portsmouth, New Hampshire, harbor piles will stand twenty-five years. One open nail-hole in a sheet of copper upon a vessel's bottom will allow the worm access to pursue its work of destruction. All kinds of wood used in ship-building are attacked by it. To secure the bottoms of ships from the salt-water worm, and from coral deposits, Mr. Jarvis recommends putting three coats of white zinc paint on the dry bottom of the vessel, then copper them; and to make the whole invulnerable, put three more coats of white zinc paint upon the outer surface of the copper. To preserve piles, drive them with the bark on. There is no danger while the bark remains. The barnacle on piles does no injury. Charring is excellent, provided the fissures are well filled with hot coal tar or zinc paint, which will be found excellent to keep the shell-fish from the wood where piles may have the bark broken off before being driven.

Terra Japonica, the commercial name of catechu (cutch) and gambir. It is stated that it is obtained by boiling the wood of the trees of which it is a product. But catechu is also obtained direct from the tree by tapping in the same way as caoutchouc (India rubber). Terra japonica gives out the large portion of tannin which it contains more readily than oak bark or most other substances, and is, therefore, preferred by those tanners who work on the quick process. Later, also, it has been extensively used as a dye, producing a brown color.

Texas, the most southern State in the Union, is situated between lat. 26° and 36° 30' N., and between long. 94° and 107° W. from Greenwich, and contains 325,520 square miles.

Early History of Texas.—The regions which we now comprise under the name of Texas, to the northwest of the Gulf of Mexico, were called by the Spanish governor of Jamaica, Garay, when his Captain, Pineda (1519), had sailed along them, *Provincia de Amichel*. It is a name of the origin of which we are quite in the dark. Perhaps, also, the whole northern shore of the Gulf was comprised under it. This expression, *Provincia de Amichel*, was pointed out as the original Indian name of the land. Because it was discovered by the exertions of Garay, the Spanish geographers, therefore, gave to it also the Spanish name, *Tierra de Garay* (Garay's country), which name we see on many old maps round the whole northern shore of the Gulf, including Texas. When (about 1521) the King of Spain divided the discoveries and governments of Cortez and Garay, and put the Rio de las Palmas as the northern boundary of the government of Mexico, the countries to the north were very often called *El Gobierno del Rio de las Palmas* (the government of the Palm River); and this also included a great part of the countries to the north. Because, however, the efforts of Garay to form a province in the north were

unfortunate, and because all the first attempts toward the north were either made from Mexico or from the peninsula of Florida, so these two names prevailed, and divided the whole region among each other. The great conquerors of the north, Narvaez and De Soto, entered from Cuba and from the peninsula of Florida. The names *Provincia Amichel*, *Tierra Garay*, *Gobierno del Rio de las Palmas*, disappeared soon after, and every thing round the whole Gulf of Mexico, up to the Palms River in the west, was comprised under the general name of Florida. As soon as Mexican travelers traversed the Palms River they considered themselves to be in Florida. When Moscoso (1542) made his excursion from the Red River westward to the centre of Texas, he found there innumerable herds of buffaloes, and called this country, from which he returned to the east, *La Provincia de los Vaqueros* (the province of the Herds). Some authors consequently gave that name to what we now call Texas. The Spaniards in Mexico commonly called all those wild Indians to the north of the civilized empire of Montezuma *Los Indios bravos* (the savage Indians), or *Los Chichimecas*. The whole country north of the Palms River was, therefore, very often designated as "the Province of the Chichimecas, or of the Savage Indians" (*La Provincia de los Chichimecas, or de los Indios bravos*). It was a custom from which also grew out the name of the Rio Bravo. When the French, under La Salle, arrived on the coasts of Texas (1685), they took possession of it under the name and as a part of their great country, *La Nouvelle France* (New France); which name, according to their notions, covered as much ground as the name of Florida, according to the Spanish ideas; that is to say, the whole eastern half of North America. The French from this time considered Texas to be a part of their dominion as far south as the Rio Bravo, and called it also Louisiana, when they had erected their Mississippi colony after 1699, and had given to it officially that name after 1712. All their old maps of Louisiana go as far down as Rio Bravo, and include Texas. Meanwhile the Spaniards had, however, taken actual possession of that province, and gave another name to it.

Some believe the word Texas to be Indian, and say that when Alonzo de Leon, in 1689, arrived among them he heard them often use the word Texas as a term of love or friendship. Others suppose that the word is Spanish, and that it implies some indication of "the manner of the Indians in constructing or covering tents or wigwams." But this seems a not well-founded supposition; for the Spanish word *Teja* (*plur. Tejas*) does not appear to have any thing to do with a covering of a tent or wigwam; it means simply "a tile."—See YOKUM, *History of Texas*.

The first Frenchman who pronounced this name, in the year 1719, La Harpe (an officer in Louisiana, well known by his travels and writings), received it evidently through the Spaniards. He calls the country of the Cenis Indians *Las Tekas*. Some old French authors write also *La province de Lastikas*. In the year 1727, for the first time, a separate "governor for the province of Texas" alone was nominated; but this province extended then only as far south as the River Medina. The southwestern part of our present Texas belonged still for a long while to "the province of Coahuila."—YOKUM, I. 393.

It is supposed that with this establishment of Texas as a new and separate government for itself (in 1727) was also connected an introduction of a new name—of *Las Nuevas Filipinas* (the new Philippines), given to this government in honor of King Philip V. At least neither Barcia nor any other author used this name before this time, while we afterward find it repeatedly in official papers and documents. The old and popular name of *Los Texas* was, however, used besides it. We see both names still on maps of a very late date; as, for instance, on a Mexican map of the

year 1813, *Provincia de Texas o Nuevas Filipinas* (the province of Texas, or the new Philippines). Until 1824, the dominion of this name did, however, southward, not reach the Rio Bravo. The province of Coahuila and of Nuevo Sant Ander took away the whole southwestern quarter of Texas, as far east and north as the Rio Medina and the sources of the Colorado and Brazos. Eastward, toward Louisiana, the province of Texas and New Philippines extended to the neighborhood of the Red River, and on the shores of the Mexican Gulf to the Rio Calcasieu, and sometimes as far as the Merrmentau. In the year 1824, under the dominion of the Mexican Republic, the old connected provinces of Coahuila and Texas were again melted together into one state, under the name of *El Estado de Texas y Coahuila*. The southern part of our Texas, about the lower Rio Bravo, as far northeast as the Medina River, was not yet included in this name. It became a part of the new created *Estado de Tamaulipas*. Sometimes, and on some maps, it was tried at this period to apply to the whole of Texas the name of Fredonia, which was the particular name of Austin's colony. This has been done, for instance, in that otherwise excellent *Dictionnaire de Geographie*, edited by a society of French geographers. In the year 1836 Coahuila and Texas were divided again, and *Texas became a separate and independent State*, which was (1845) annexed to the United States, and received, then, after the war of 1846, its present boundaries. These boundaries extend from this time along the Gulf of Mexico, from the mouth of the Rio Bravo in the south to the mouth of the Sabina in the east. To show how far and in what manner the boundaries of this name and State were extended toward the interior does not belong to our hydrographical researches.—J. G. KOHL.

The general aspect of the country is that of a vast inclined plane, gradually sloping from the mountains eastward to the sea, and traversed by numerous rivers, all having a southeast direction. It may be naturally divided into three regions; the first, which is level, extends along the coast with a breadth varying from 100 to 80 miles, being narrowest at the southwest. The soil of this region is principally a rich alluvion, with scarcely a stone, and singularly free from stagnant swamps. Broad woodlands fringe the banks of the rivers, between which are extensive and rich pasture lands. The second division, the largest of the three, is the undulating prairie region which extends for 150 or 200 miles farther inland, its wide, grassy tracts alternating with others that are thickly timbered. Limestone and sandstone form the common substrata of this section. The third, or mountainous region, situated principally on the west and southwest, forming part of the Sierra Madre, or Mexican Alps, is but little explored. At its remote extremity it consists of an elevated table-land, resembling the vast steppes of Asia, except in their superior fertility. The mountain sides are clothed with forests, and there are few, if any districts of country of the same extent as Texas, with so little unproductive land.

The principal rivers in the State are the Sabine, Neches, Trinidad, Brazos, Colorado, Guadalupe, San Antonio, Nueces, and the Rio Grande. The Neches is navigable for small steamboats for more than 100 miles, Trinidad River for 300 or 400 miles, and the Brazos for half that distance. The Rio Colorado is obstructed by a raft 10 miles from its mouth; it will, when removed, be navigable for steamboats 200 miles to Austin City. The San Antonio and Nueces are navigable for only a short distance; but the Rio Grand del Norte, a noble stream, having a course of 1800 miles, will most probably, though in parts broken by rapids, become hereafter an important commercial channel. Galveston Bay, into which the Trinidad flows, is about 35 miles in length, and from 12 to 18 miles wide. The Gulf of Mexico bounds its southeastern border, on which are many bays and some good harbors. The Texan year

is divided into wet and dry seasons; the former lasts from December to March, and the latter from March to December. Snow is seldom seen except on the mountains. The country is in most parts covered with a luxuriant native grass, and it is amply supplied with timber, among which are the live oak, white, black, and post oak, hickory, walnut, sycamore, caoutchouc, etc., and on the high lands pine and cedar. The "Cross Timbers" are two lines of continuous forests of great extent. Cotton and sugar-cane are the great agricultural staples, both of which attain to great perfection. The grains chiefly cultivated are Indian corn and wheat. Peaches, melons, figs, oranges, lemons, pine-apples, dates, olives, grapes, etc., grow abundantly. Great numbers of cattle and horses are reared, and vast herds of buffaloes and wild horses wander over the prairies, while deer and game are abundant. Among its minerals are coal of a superior quality, iron ore, limestone, granite, slate, gypsum, etc. Silver

mines have been wrought in the mountains, and bitumen and salt are abundant.

Manufactures, etc.—There were in the State in 1850 one woolen factory, with a capital invested of \$8000, employing four males and four females, manufacturing 14,000 yards of cloth, etc., valued at \$15,000; two establishments with a capital of \$16,000, employing 35 persons, and making 200 tons of iron castings, etc., valued at \$55,000; 88 flouring and grist mills, 89 saw-mills, 22 tanneries, 34 printing-offices, three tri-weekly, two semi-weekly, and 32 weekly publications. Capital invested in manufactures, \$613,238; value of manufactured articles, \$1,202,885.

The principal places in the State are Austin, the capital, Galveston, Houston, Washington, Matagorda, San Felipe de Austin, San Augustine, Nacogdoches, San Antonio de Bexar, Corpus Christi, and Brownville. There were, January 1st, 1856, 36 miles of railroad built.

FOREIGN COMMERCE OF THE STATE OF TEXAS, FROM JULY 1, 1845, TO JULY 1, 1857, SHOWING ALSO THE DISTRICT TONNAGE IN 1846.

—See SPANISH COLONIES for commerce prior to the year 1846.

Thaler, a German silver coin, first coined in Joachimsthal, a valley in Bohemia. The value of the thaler is about seventy cents.—See COINS, GERMANY, and DOLLAR.

Thames (*Tamesis*), the principal though not the longest river of England, through the south part of which it flows mostly in an easterly direction. It rises under the name of the Isis, about two miles south of Cirencester, and 376 feet above the sea, flows at first south to near Cricklade, then east-northeast past Lechlade to near Oxford, and southeast past Oxford, Abingdon, and Wallingford to Reading, after which its course is mostly eastward to Gravesend. A few miles beyond this it expands into an estuary, which at its junction with the North Sea at the Nore, between the Isle of Sheppey and Foulness Point, is fifteen miles across, and has on its opposite banks the towns Sheerness and Southend. Total course estimated at 215 miles. At Dorchester it receives the Thamer from the north, and thenceforth assumes its proper name; other principal affluents are the Churnet, Coln, Wainrush, Evenlode, Cherwell, Colne, Brent, Lea, and Roding from the north, and the Cole, Kennet (its chief affluent), Wey, Mole, and some smaller rivers from the south. The Mersey joins its estuary at Sheerness. Its basin is of less size than that of the Severn, but no river in the world has more commercial importance. The tide flows up it for about eighty miles; it is navigable for ships of any burden to Deptford, for vessels of 200 tons to London Bridge, and for barges 180 miles farther, where it is united by the Thames and Severn Canal with the Severn, below Gloucester; it is also connected with all the centre of England by the Oxford and Warwick and Grand Junction Canals, and by other canals with Bristol, Basingstoke, Arundel, etc. Under the Romans it formed the north boundary of the province of *Britannia prima*.

The Thames is the richest river in the world. It has been erroneously said that its name is Isis till it arrives at Dorchester, when, being joined by the

Thame or Tame, it assumes the name of Thames. What was the origin of this common error can not now be traced: poetical fiction, however, has perpetuated the error, and invested it with a kind of classical sanctity. It was called Thames or Tems before it came near the Thame.—CAMDEN. The river rose so high at Westminster that the lawyers were brought out of the hall in boats, A.D. 1235. Again it rose to great height, 1736, 1747, 1762, and 1791. The conservation of the Thames was given to the mayors of London, 1489. The Thames was made navigable to Oxford, 1624. It ebbed and flowed twice in three hours, 1658. Again, three times in four hours, March 22, 1682. Again, twice in three hours, November 24, 1777.—See article TUNNEL.

Thermometer. The invention of this instrument is ascribed to several scientific persons, all about the same time. Galileo, 1597.—LIBRI. Invented by Drebbel of Alcmara, A.D. 1609.—BOERHAAVE. Invented by Paulo Larpi in 1609.—FULGENTIO. Invented by Santorio in 1610.—BORELLI. Fahrenheit's thermometer was invented about 1726; and the scale called Reaumur's soon after, 1730. The mode of construction by substituting quicksilver for spirits was invented some years subsequently.—HAYDN.

Thimble. This simple yet useful, and now indispensable appendage to the ladies' work-table, is of Dutch invention. The art of making them was brought to England by John Lofting, a mechanic from Holland, who set up a work-shop at Islington, near London, and practiced the manufacture of them in various metals with profit and success, about 1695.—HAYDN.

Thread (Ger. *Zwirn*; Du. *Garen*; Fr. *Fil*; It. *Refe*; Sp. *Hilo*, *Torzal*; Russ. *Nitki*), a small line made up of a number of fibres of some vegetable or animal substance, such as flax, cotton, or silk; whence its names of linen, cotton, or silk thread.—See COTTON MANUFACTURE.

Tide Gauge, a mechanical contrivance for registering the state of the tide continuously at every in-

stant of time. In the *Philos. Trans.* for 1838, there is a description of a very complete self-registering machine for this purpose, erected at Bristol by Mr. Bunt. The principal parts are an eight-day clock, which turns a vertical cylinder revolving once in twenty-four hours; a wheel, to which an alternate motion is communicated by a float rising and falling with the tide, and connected with the wheel by a wire passing over a pulley, and kept constantly strained by a counterpoise; and a small drum on the same axis with the wheel, which, by a suspending wire, communicates one-eighteenth of the vertical motion of the float to a bar carrying a pencil, which describes a curve on the cylinder, and thereby marks the fluctuations, and the time and height of high water.

Tides, the alternate rise and fall of the waters of the ocean. The moon is the principal agent in the production of the tides; but they are modified, both with respect to their height and the times at which they happen, by the action of the sun. The effect of the planets is inappreciable. Homer is the earliest profane author who speaks of the tides. Posidonius of Apamea accounted for the tides from the motion of the moon, about 79 B.C.; and Cæsar speaks of them in his fourth book of the Gallic War. The theory of the tides was first satisfactorily explained by Kepler, A.D. 1598; but the honor of a complete explanation of them was reserved for Sir Isaac Newton, who laid hold of this class of phenomena to prove universal gravitation, about 1683.

The attractive force of a body on a distant particle of matter varying inversely as the square of the distance, the particles of the earth on the side next the moon will be attracted with a greater, and those on the opposite side with a smaller force, than those which are situated intermediately. The gravitation toward the earth's centre of the particles nearest the moon will therefore be diminished, and consequently, if at liberty to move among themselves, they will rise above the general level. In like manner, the moon's attraction on the most distant particles being less than on the central ones, their relative gravitation toward the centre will also be diminished, and the waters will consequently be heaped up on the side of the earth which is turned away from the moon. Hence, if the earth were at rest, the ocean would take the form of an oblong spheroid, with its longer axis passing through the attracting body; and it may be shown from theory that the spheroid would be in equilibrium under the influence of the moon's attraction, if the longer semi-axis exceeded the shorter by about 58 inches. But in consequence of the rapid rotation of the earth about its axis, the spheroid of equilibrium is never fully formed; for before the waters can take their level, the vertex of the spheroid has shifted its position on the earth's surface, in consequence of which an immensely broad and very flat wave is formed, which follows the motions of the moon at some interval of time. In the open sea the time of high water is, in general, from two to three hours after the moon's transit over the meridian either above or below the horizon. The tidal wave, it is to be observed, is entirely different from a current: the particles of water merely rise and fall; but except when the wave passes over shallows, or approaches the shore, there is little or no progressive motion.

The waters of the ocean are affected in a similar manner by the action of the sun, under the influence of which they have a tendency to assume at every instant the form of an elongated spheroid; but although the attractive force of the sun is immensely greater than that of the moon, yet, by reason of the greater distance of the sun, the difference of the effect on particles situated on opposite sides of the earth (on which difference the phenomena depend) is very much less. The solar tides are therefore comparatively small with respect to the lunar tides, and, in fact, are never per-

ceived as distinct phenomena, but become sensible only from the modifications which they produce in the heights and times of those which primarily depend on the moon. At the syzygies, when the sun and moon come to the meridian together, the tides are, *ceteris paribus*, the highest; at the quadratures, or when the sun and moon are 90° distant, the tides are least. The former are called *spring tides*, the latter *neap tides*. Although we are not in possession of data to enable us to compute the exact height either of the spring or neap tides, yet their relative heights in the open ocean probably correspond very nearly to the ellipticities of the spheroids of equilibrium that would be formed under the action of the two bodies exerted separately. Now the ellipticity of the aqueous spheroid formed by the moon's action is about five feet, and the ellipticity of that formed by the sun's action about two feet; therefore, the spring and neap tides being the sum and difference of the separate effects, the average spring tide will be to the average neap in the ratio of about 7 to 3.

The apparent time of high water at any port, in the afternoon of the day of new or full moon, is what is usually called the *establishment of the port*. Mr. Whewell calls this the *vulgar establishment*, and the mean of all the intervals of tide and transit for a half lunation he terms the *corrected establishment*. This corrected establishment is consequently the lunitidal interval corresponding to the day on which the moon passes the meridian exactly at noon or midnight.

The two tides immediately following one another, or the tides of the day and night, vary, both in height and time of high water, at any particular place with the distance of the sun and moon from the equator. As the vertex of the tide wave always tends to place itself vertically under the luminary which produces it, it is evident that, of two consecutive tides, that which happens when the moon is nearest the zenith or nadir will be greater than the other; and consequently, when the moon's declination is of the same denomination as the latitude of the place, the tide which corresponds to the upper transit will be greater than the opposite one, and *vice versa*, the differences being greatest when the sun and moon are in opposition, and in opposite tropics. This is called the *diurnal inequality*, because its cycle is one day; but it varies greatly at different places, and its laws, which appear to be governed by local circumstances, are very imperfectly known.

We have now described the principal phenomena that would take place were the earth a sphere, and covered entirely with a fluid of uniform depth. But the actual phenomena of the tides are infinitely more complicated. From the interruption of the land, and the irregular form and depth of the ocean, combined with many other disturbing circumstances, among which are the inertia of the waters, the friction on the bottom and sides, the narrowness and length of the channels, the action of the wind, currents, difference of atmospheric pressure, etc., great variation takes place in the mean times and height of high water at places differently situated; and the inequalities above alluded to, as depending on the parallax of the moon, her position with respect to the sun, and the declination of the two bodies, are, in many cases, altogether obliterated by the effects of the disturbing influences, or can only be detected by the calculation and comparison of long series of observations.

By reason of these disturbing causes, it becomes a matter of great difficulty to trace the propagation of the tide wave, and the connection of the tides in different parts of the world. In the *Philosophical Transactions* for 1832, Sir John Lubbock published a map of the world, in which he inserted the times of high water at new and full moon at a great number of places on the globe, collected from various sources, as works on navigation, voyages, sailing directions, etc.; and,

in order that the march of the tide wave might be traced more readily, the times were expressed in Greenwich time as well as the time of the place. In the same *Transactions* for 1833, Mr. Whewell prosecuted this subject at greater length; and availing himself of *a priori* considerations, as well as of a mass of information collected in the hydrographer's office at the Admiralty, inserted in the map a series of *cotidal lines*, or lines along which high water takes place at the same instant of time. But these cotidal lines, as Sir J. Lubbock remarks, are entirely hypothetical; for we have few opportunities of determining the time of high water at a distance from the coast, though this is sometimes possible by means of a solitary island, as St. Helena.—LUBBOCK'S *Elementary Treatise on the Tides*, 1839.

According to Mr. Whewell's deductions, the general progress of the great tide wave may be thus described: It is only in the Southern Ocean, between the latitudes of 30 and 70 degrees, that a zone of water exists of sufficient extent to allow of the tide wave being formed. Suppose, then, a line of contemporary tides, or *cotidal lines*, to be formed in the Indian Ocean, as the theory supposes, that is to say, in the direction of the meridian, and at a certain distance to the eastward of the meridian in which the moon is. As this tide wave passes the Cape of Good Hope, it sends off a derivative undulation, which advances northward up the Atlantic Ocean, preserving always a certain proportion of its original magnitude and velocity. In traveling along this ocean the wave assumes a curved form, the convex part keeping near the middle of the ocean, and ahead of the branches, which, owing to the shallower water, lag behind on the American and African coasts; so that the cotidal lines have always a tendency to make very oblique angles with the shore, and, in fact, run nearly parallel to it for great distances. The main tide, Mr. Whewell conceives, after reaching the Orkneys, will move forward in the sea bounded by the shores of Norway and Siberia on the one side, and those of Greenland and America on the other, will pass the pole of the earth, and finally end its course on the shores in the neighborhood of Behring's Straits. It may even propagate its influence through the straits, and modify the tides of the North Pacific. But a branch tide is sent off from this main tide into the German Ocean; and this, entering between the Orkneys and the coast of Norway, brings the tide to the east coast of England, and to the coasts of Holland, Denmark, and Germany. Continuing its course, part of it, at least, passes through the Strait of Dover, and meets in the British Channel the tide from the Atlantic, which arrives on the coast of Europe twelve hours later; but in passing along the English coast, another part of it is reflected from the projecting land of Norfolk upon the north coast of Germany, and again meets the tide wave on the shores of Denmark. Owing to this interference of different tide waves, the tides are almost entirely obliterated on the coast of Jutland, where their place is supplied by continual high water.

In the Pacific Ocean the tides are very small, but there are not sufficient observations to determine the forms and progress of the cotidal lines. Off Cape Horn, and round the whole shore of Terra del Fuego, from the western extremity of the Strait of Magalhães to Staten Island, it is very remarkable that the tidal wave, instead of following the moon in its diurnal course, travels to the eastward. This, however, is a partial phenomenon; and a little farther to the north of the last-named places the tides set to the north and west. In the Mediterranean and Baltic seas the tides are inconsiderable, but exhibit irregularities for which it is difficult to account. The Indian Ocean appears to have high water on all sides at once, though not in the central parts at the same time.

Since the tides on our coasts are derived from the

oscillations produced under the direct agency of the sun and moon in the Southern Ocean, and require a certain interval of time for their transfer, it follows that, in general, the tide is not due to the moon's transit immediately preceding, but is regulated by the position which the sun and moon had when they determined the primary tide. The time elapsed between the original formation of the tide and its appearance at any place is called the *age* of the tide, and sometimes, after Bernoulli, the *retard*. On the shores of Spain and North America the tide is a day and a half old; in the port of London it appears to be two days and a half old when it arrives.

Velocity of the Tide Wave.—In the open ocean the crest of the tide travels with enormous velocity. If the whole surface were uniformly covered with water, the summit of the tide wave, being mainly governed by the moon, would every where follow the moon's transit at the same interval of time, and consequently travel round the earth in a little more than twenty-four hours. But the circumference of the earth at the equator being about 25,000 miles, the velocity of propagation would therefore be about 1000 miles per hour. The actual velocity is perhaps nowhere equal to this, and is very different at different places. In latitude 60° south, where there is no interruption from land (excepting the narrow promontory of Patagonia), the tide wave will complete a revolution in a lunar day, and consequently travel at the rate of 670 miles an hour. On examining Mr. Whewell's map of cotidal lines, it will be seen that the great tide wave from the Southern Ocean travels from the Cape of Good Hope to the Azores in about twelve hours, and from the Azores to the southernmost point of Ireland in three hours more. In the Atlantic the hourly velocity in some cases appears to be 10° of latitude, or near 700 miles, which is almost equal to the velocity of sound through the air. From the south point of Ireland to the north point of Scotland the time is eight hours, and the velocity about 160 miles an hour along the shore. On the eastern coast of Britain, and in shallower water, the velocity is less. From Buchanness to Sunderland it is about sixty miles an hour; from Scarborough to Cromer, thirty-five miles; from the North Foreland to London, thirty miles; from London to Richmond thirteen miles an hour in that part of the river.—WHEWELL, *Phil. Trans.*, 1833 and 1836. It is scarcely necessary to remind the reader that the above velocities refer to the transmission of the undulation, and are entirely different from the velocity of the current to which the tide wave gives rise in shallow water.

Theory of the Tides.—The theory of the tides, considered as a consequence of solar and lunar attraction, was first sketched by Newton in the *Principia*. In the 36th and 37th propositions of the third book, he determines the forces of the sun and moon to elevate the waters of the ocean, on the supposition that the sea is a fluid of the same density as the earth, covering the whole terrestrial surface, and which takes at every instant the figure of equilibrium. He assumes, without demonstration, that this figure is an elongated spheroid. One spheroid he supposes to be formed under the action of the sun, another under the action of the moon; and, by reason of the smallness of their eccentricities, they may be conceived as superposed the one on the other. From these suppositions he deduced the general phenomena of the ebb and flow of the sea; and by comparing his theory with observations of the heights of the spring tides made at the mouth of the Avon, near Bristol, he determined the ratio of the attraction of the moon to that of the sun to be nearly 4.48 to 1; whence he deduced the mass of the earth to be to that of the moon as 39.788 to 1, the density of the sun to that of the earth as 1 to 4, and the density of the moon to that of the earth as 11 to 9. Newton's theory was defective in many points of view, but fifty

years elapsed before it received any improvement. In 1788 the subject of the tides was proposed as a prize question by the French Academy of Sciences, which gave occasion to the celebrated treatises of Daniel Bernoulli, Maclaurin, and Euler. Maclaurin's Essay is remarkable, as containing a demonstration of the theorem assumed by Newton, that the elliptic spheroid affords an equilibrium under the action of the disturbing forces: those of Bernoulli and Euler, though they furnish no new principle of equal or similar importance in point of theory, enter more into details, and contain many useful illustrations. That of Bernoulli, indeed, contains a table which has served as the model for all those (not purely empirical) which have since been formed. The next important step in the theory of the tides was taken by Laplace, who first treated the subject as a general question of hydrodynamics, and attempted to deduce the principal phenomena from the equations of the motions of fluids. But in order to simplify the equations, which are of a very complicated nature, he was forced to have recourse to the hypothesis of a fluid covering entirely a spheroid of a regular surface, and consequently the results were far from representing the actual observations of the tides at any port. The late Dr. Thomas Young (*Ency. Brit., article TIDES*) extended Laplace's method to the more general case of an ocean covering a part only of the earth's surface, and more or less irregular in its form, and attempted also to include in his calculation the effects of hydraulic friction on the times and magnitudes of the tides.

Influence of Atmospheric Pressure and Winds.—Besides the numerous causes of irregularity depending on the local circumstances, the tides are also affected by the state of the atmosphere. At Brest, the height of high water varies inversely as the height of the barometer, and rises more than eight inches for a fall of about half an inch of the barometer. At Liverpool, a fall of one-tenth of an inch in the barometer corresponds to a rise in the River Mersey of about an inch; and at the London Docks, a fall of one-tenth of an inch corresponds to a rise in the Thames of about seven-tenths of an inch. With a low barometer, the tides may therefore be expected to be high, and *vice versa*. The tide is also liable to be disturbed by winds. Sir J. Lubbock states that, in the violent hurricane of January 8, 1839, "there was no tide at Gainsborough, which is twenty-five miles up the Trent—a circumstance unknown before. At Saltmarsh, only five miles up the Ouse from the Humber, the tide went on ebbing, and never flowed till the river was dry in some places; while at Ostend, toward which the wind was blowing, contrary effects were observed. During strong northwesterly gales the tide marks high water earlier in the Thames than otherwise, and does not give so much water, while the ebb-tide runs out late, and marks lower; but upon the gales abating and the weather moderating, the tides put in, and rise much higher while they also run longer before high water is marked, and with more velocity of current; nor do they run out so long or so low.—BRANDE'S *Cyclopædia*.

The tidal observations of the Pacific coast have casually led to a determination of great scientific interest, that of the average depth of the Pacific Ocean between the coasts of Japan and California. On the 23d of December, 1854, an earthquake occurred in Japan by which the town of Simoda, in the island of Nippon, was destroyed. From the imperfect accounts which have reached us, it appears that at nine A.M. on that day the severe shock of an earthquake was felt on board the Russian frigate *Diana*, then lying in the harbor of Simoda. Half an hour later the sea came into the bay in an immense wave thirty feet in height, overwhelming the town and then receding. This advance and recession occurred five times, and by 2:30 P.M. all was again quiet. The depth of the sea during these changes varied from less than eight to more

than forty feet. Upon the same day an extraordinary rise and fall of water was observed at Peel's Island, one of the Bonin Islands, and the tide continued to rise and fall during the day at intervals of fifteen minutes, gradually lessening until evening.—*American Journal of Science*, January, 1858 [Prof. BACHE].

The following table contains the revised data for the principal tidal elements of a number of points on the coast of the United States, with additions to the tables published last year, furnished by the discussions of the tidal observations. These elements are selected from a large number of results obtained in the progress of the Coast Survey, only those stations being reported, as a general rule, where the observations extended through at least two lunations.

GENERAL TIDE TABLE FOR THE COAST OF THE UNITED STATES.

* Varying between 20 and 24 feet of water.

† The highest tides occur at the moon's greatest declination, and are applied in the column headed "Spring Tides."

Range of the Tide.—The difference of level between high and low water is affected by various causes, but chiefly by the configuration of the land, and is very different at different places. In deep inbends of the shore, open in the direction of the tide wave, and gradually contracting like a funnel, the convergence of

the water causes a very great increase of the range. Hence the very high tides in the Bristol Channel, the Bay of St. Malo, and the Bay of Fundy, where the tide is said to rise sometimes to the height of 100 feet. Promontories, under certain circumstances, exert an opposite influence, and diminish the tide.

Tide-rips.—Near the equator, and especially on this side of it in the Atlantic, mention is made, in the "abstract log," by almost every observer that passes that way, of "tide-rips," which are a commotion in the water, not unlike that produced by a conflict of tides or of other powerful currents. These "tide-rips" sometimes move along with a roaring noise, and the inexperienced navigator always expects to find his vessel drifted by them a long way out of her course; but when he comes to cast up his reckoning the next day at noon, he remarks with surprise that no current has been felt. Tide-rips are usually found in the neighborhood of the equatorial calms—that region of constant precipitation. And hence, if currents at all—if so, they are very superficial—I have thought they might be streams of rain-water, which old seamen tell us they have dipped up there fresh from the sea, running off. This conjecture, however, does not satisfy the phenomenon in all of its aspects. It is sometimes described as starting up in a calm, and then approaching the vessel with great waves and a great noise; it seems threatening enough to excite a feeling of apprehension in the minds of seamen, for it looks as if it would dash over their frail bark as it lies wallowing in the sea, and helplessly flapping its sails against the masts. Captain Higgins, of the *Maria*, when bound from New York to Brazil, thus describes, in his abstract log, one of these "tide-rips," as seen by him, 10th October, 1855, in lat. 14° N., long. 34° W.: "At three P.M. saw a tide-rip, in the centre, temperature of air 80°, water 81°. From the time it was seen to windward, about three to five miles, until it had passed to leeward out of sight, it was not five minutes. I should judge it traveled at not less than sixty miles per hour, or as fast as the bores of India. Although we have passed through several during the night, we do not find they have set the ship to the westward any; it may be that they are so soon passed that they have no influence on the ship, but they certainly beat very hard against the ship's sides, and jarred her all over. They are felt even when below, and will wake one out of sleep."—*MAURY'S Physical Geography*. For further information as to TIDES, refer to *Amer. Jour. of Sci.*, xxxiv. 81, xvi. 78, xx. 205, xlv. 118, xii. (2d series) 341 (A. D. BACHE); *South. Lit. Mess.*, iv. 747; *Mass. Quart. Rev.*, ii. 77; *Quart. Rev.*, vi. 74; *Anal. Mag.*, ix. 231.

Tiles (Ger. *Dachziegel*; Fr. *Tuiles*; It. *Tegole*, *Embrici*; Sp. *Tejas*; Russ. *Tscherepiza*), a sort of thin bricks, dried in kilns, and used in covering and paving different kinds of buildings. The best brick earth only should be made into tiles.

Timber (Ger. *Bauholz*, *Zimmer*; Du. *Timmerhout*; Fr. *Bois de charpente*, *Bois à bâtir*; It. *Legname da fabbricare*; Sp. *Madera de construccion*; Russ. *Строительный лес*; Pol. *Cembrowina*), the term used to express every large tree squared, or capable of being squared, and fit for being employed in house or ship-building. In the language of the English customs, when a tree is sawn into thin pieces, not above seven inches broad, it is called batten; when above that breadth, such thin pieces are called deal. Wood is the general term, comprehending under it timber, dye-woods, fire-wood, etc.

The following are the contents of the loads of different species of timber, hewn and unhewn:

A load of timber, unhewn	40 cubic feet.
" square timber	50 "
" 1 inch plank	600 square feet.
" 1½ inch plank	400 "
" 2 inch plank	300 "
" 2½ inch plank	240 "
" 3 inch plank	200 "
" 3½ inch plank	170 "
" 4 inch plank	150 "

36½ Russian standard deals, 12 feet long, 1½ inch thick, 11 inches broad, make 1 load of timber.

58½ Christiana standard deals, 11 feet long, 1½ inch thick, 9 inches broad, make 1 load of timber.

53½ Dram standard deals, 10 feet long, 1½ inch thick, 9 inches broad, make 1 load of timber.

3 Riga logs make 1 load of timber.

—See LUMBER TRADE.

The annual demand of timber for the British navy, in war, is 60,000 loads, or 40,000 full-grown trees, a ton each, of which thirty-five will stand on an acre; in peace, 32,000 tons, or 48,000 loads. A seventy-four gun ship consumes 8000 loads, or 2000 tons of trees, the produce of fifty-seven acres in a century. Hence the whole navy consumes 102,600 acres, and 1026 per annum.—**ALLNUT.** England imports about 800,000 loads of timber annually, exclusively of masts, yards, staves, lathwood, etc., together with about 8,000,000 of deals and deal-ends.—*Parl. Ret.*

To overcome the difficulty of bending timber, a method has been discovered which, to judge from the accounts given by the most eminent engineers, both of America and England, will be of the greatest service in ship-building and domestic architecture, and in the construction of all pieces of furniture in which it is necessary to employ curved timber. It has been already so employed in the United States.

By this invention, which has been patented in America, the strength of the wood is increased at least 75 per cent. at the point where strength is most required. The curve, moreover, never relaxes. The timber, as in the old process, is first subjected to the influence of steam, which softens the whole mass, and puts it in a fit state for the action of a machine. The principle of

bending, as employed in this new application, is based on end-pressure, which, in condensing and turning at the same time, destroys the capillary tubes by forcing them into each other. These tubes are only of use when the tree is growing; and their amalgamation increases the density of the timber, the pressure being so nicely adjusted that the wood is neither flattened nor spread, nor is the outer circumference of the wood expanded, though the inner is contracted. Now the error of the former process, as expounded by competent judges, has arisen from the disintegrating of the fibre of the wood by expanding the whole mass over a rigid mould. Wood can be more easily compressed than expanded; therefore, it is plain that a process which induces a greater closeness in the component parts of the piece under operation—which, as it were, locks up the whole mass by knitting the fibres together—must augment the degree of hardness and power of resistance. The wood thus becomes almost impervious to damp and to the depredations of insects, while its increased density renders it less liable to take fire; and the present method of cutting and shaping timber being superseded, a saving of from two to three-fourths of the material is brought about. The action of the machine throws the cross-grains into right angles; the knots are compelled to follow the impulse of the bending; the juices are forced out of the cells of the wood, and the cavities are filled up by the interlacing fibres. In the same way, you may sometimes see in the iron of which the barrels of muskets are made a kind of dark grain which indicates that the particles of the metal, either in the natural formation or in the welding, have been strongly clinched in one another. The specimens are always greatly valued for their extraordinary toughness, as well as for a certain fantastical and mottled beauty.

Another of the good results of this new method is that the wood is seasoned by the same process as that which effects the bending. The seasoning of the wood is simply the drying of the juices, and the reduction of the mass to its minimum size before it is employed, so that there shall be no future warping. But, as we have already shown, the compression resorted to in the American system at once expels the sap; and a few hours are sufficient to convert green timber into thoroughly seasoned wood. Here is an obvious saving of time, and also of money; for the ordinary mode of seasoning, by causing the wood to lie waste for a considerable period, locks up the capital of the trader, and of course enhances the price to the purchaser. Time also will be saved in another way, in searching for pieces of wood of the proper curve for carrying out certain designs. "How delighted," says Mr. Jervis, the United States inspector of timber, "will the shipwright be to get clear of the necessity of searching for crooked pieces of timber! There need no longer be any breaking of bats in the frame, as we have been wont to break them. We shall see numbers one, two, and three futtocks, at least, all in one piece." An English engineer (Mr. Charles Mayhew) remarks, that one of the advantages of the American method is that, "in its application to all circular, wreathed, or twisted work, it not only preserves the continuous grain of the wood, which is now usually and laboriously done by narrow slips of veneer glued on cores cut across the grain, with many unsightly joints, ill concealed at best; but it will materially reduce the cost of all curved work, which now varies according to the quickness of the sweep, and will give the artist greater freedom in his design, by allowing him to introduce lines which are now cautiously avoided in order to prevent the cost of their execution." Dr. Hooker, Mr. Fairbairn, Mr. Rennie, Mr. Gallway, civil engineer, and other eminent scientific men, confirm these judgments. A specimen of bent oak now lies before us, and exhibits a beautiful continuity in the sweep of the fibres. Timber-bending has reached a new stage of develop-

ment; and it is not too much to anticipate that it will have considerable influence on the industrial arts.

Tin (Ger. *Blech*, *Weissblech*; Fr. *Fer blanc*; It. *Latta*, *Banda stagnata*; Sp. *Hoja de lata*; Russ. *Blächa*, *Shest*; Arab. *Reas*; Sans. *Trapu* and *Ranga*), a metal which has a fine white color like silver; and when fresh, its brilliancy is very great. It has a slightly disagreeable taste, and emits a peculiar smell when rubbed. Its hardness is between that of gold and lead. Its specific gravity is 7.29. It is very malleable; *tin-foil*, or tin leaf, is about $\frac{1}{1000}$ th part of an inch thick; and it might be beat out into leaves as thin again, if such were required for the purposes of art. In ductility and tenacity it is very inferior. A tin wire 0.078 inch in diameter is capable of supporting a weight of 34.7 pounds only without breaking. Tin is very flexible, and produces a crackling noise when bent. It may be readily alloyed with copper, zinc, etc., forming very valuable compounds.—*THOMSON'S Chemistry*.

The Phenicians traded with England for this article for more than 1100 years before the Christian era. It is said that this trade first gave them commercial importance in the ancient world. Under the Saxons, our tin mines appear to have been neglected; but after the coming in of the Normans, they produced considerable revenues to the earls of Cornwall, particularly to Richard, brother of Henry III.; a charter and various immunities were granted by Edmund, Earl Richard's brother, who also framed the stannary laws, laying a duty on the tin, payable to the earls of Cornwall. Edward III. confirmed the tinners in their privileges, and erected Cornwall into a dukedom, with which he invested his son, Edward the Black Prince, 1387. Since that time, the heirs apparent to the crown of England, if eldest sons, have enjoyed it successively. Tin mines were discovered in Germany, which lessened the value of those in England, till then the only tin mines in Europe, A.D. 1240.—*ANDERSON*. Discovered in Barbary, 1640; in India, 1740; in New Spain, 1782. England exports at present, on an average, 1500 tons of unwrought tin, besides manufactured tin and tin-plates, of the value of about £400,000.

The ores of this metal are found in comparatively few places; the principal, and perhaps the only, ones are Cornwall, Galicia, Erzgebirge in Saxony, Bohemia, the Malay countries, China, and Banca in Asia. They are peculiar to primitive rocks, generally in granite, either in veins or beds, and are often associated with copper and iron pyrites. Tin is much used as a covering to several other metals: iron is tinned, to prevent its rapid oxidation when exposed to air and moisture; and the same process is applied to copper, to avoid the injurious effects to which those who are in the habit of employing cooking utensils made of this metal are always liable. The solutions of tin in the nitric, muriatic, nitro-sulphuric, and tartaric acids, are much used in dyeing, as giving a degree of permanency and brilliancy to several colors, to be obtained by the use of no other mordants with which we are at present acquainted: tin forms the basis of pewter, in the composition of which it is alloyed with lead; when rolled into thin sheets, it is called tin-foil, and is applied, with the addition of mercury, to cover the surface of glass, thus forming looking-glasses, mirrors, etc.; and in combination with sulphur, it constitutes what is called mosaic gold.—*JOYCE'S Chem. Min.* Tin plates, known in Scotland by the name of *white iron*, are applicable to a great variety of purposes. They are formed of thin plates of iron dipped into molten tin. The tin not only covers the surface of the iron, but penetrates it completely, and gives the whole a white color. It is usual to add about one-tenth of copper to the tin, to prevent it from forming too thick a coat upon the iron.—*THOMSON'S Chemistry*.

British Tin Trade.—The tin mines of Cornwall have been worked from a very remote era. The voyages

of the Phœnicians to the Cassiterides, or tin islands, are mentioned by Herodotus (Hb. iii. c. 115), Diodorus Siculus (lib. iv. p. 301, ed. 1604), and Strabo (*Geog.*, lib. iii.). Some difference of opinion has, indeed, been entertained as to the particular islands to which the Phœnicians applied the term Cassiterides; but Borlase (*Account of the Scilly Islands*, p. 72), Larcher (*Herodote*, tome iii. p. 384, ed. 1802), and the ablest critics, agree that they are the Scilly Islands, and the western extremity of Cornwall. After the destruction of Carthage, the British tin trade, which was always reckoned of peculiar importance, was carried on by the merchants of Marseilles, and subsequently by the Romans. Besides Britain, Spain furnished the ancients with considerable quantities of tin. We have no very precise information as to the purposes to which they applied this metal. It has been supposed that the Phœnicians, so famous for their purple dyes, were acquainted with the use of the solution of tin in nitro-muriatic acid in fixing that color. The best of the ancient mirrors, or *specula*, were also made of a mixture of copper and tin; and tin was used in the coating of copper vessels. —WATSON'S *Chemical Essays*.

In modern times, the tin mines of Cornwall and Devon have been wrought with various degrees of energy and success. Queen Elizabeth brought over some German miners, by whom some of the processes were improved. During the civil wars the mines were much neglected. At the commencement of last century, however, the business of mining was carried on with renewed vigor; and from 1720 to 1740 the annual produce was about 2100 tons. The produce went on gradually increasing, till it amounted, in the ten years from 1790 to 1800, to 3254 tons a year. During the next fifteen years the produce fell off; and for the five years ending with 1815 it was always considerably under 3000 tons a year. But in the last-mentioned year a considerable increase took place; and since 1816 the produce has been, with the exception of 1820, always above 3000 tons a year. The average produce of the mines in the year 1843 was estimated at above 5000 tons a year.

Tin, *Oriental Malay*, *Tima*; *Hind. Kalai*; *Siamese, Dibuk*; *Burmese, Kye-p'kyu*, white copper), in *Commercial language* usually called Banca tin. It is found in several provinces of China; but the most extensive, and probably richest tin district in the world, exists in the Malay countries. This comprehends the whole of the peninsula, from the extreme cape to the latitude of 14° on its western side, and to 11° on its eastern, and comprehends several of the small islands lying in the route between the peninsula and Java, as far as the latitude of 3° south; so that the whole of this tin district has an extreme length of near 1200 miles. By far the greater number of the mines within these limits are as yet unwrought and unexplored. It was only in the beginning of last century that the mines of Banca, the most productive at present worked, were accidentally discovered. The whole tin of the Malay countries is the produce of alluvial ores, or what is called in Cornwall "Stream-work;" and from the abundance in which the mineral has been found by the mere washing of the soil, no attempt has hitherto been made at regular mining, or obtaining the ore from its rocky matrix. Malay tin, consequently, is grain tin, or tin in a very pure state; that being the species which alluvial ore uniformly produces. The mines, or rather excavations, are perpendicular pits of from 15 to 25 feet deep; and when the soil and a superstratum of common clay are removed, the bed containing the ore, consisting of quartz and granitic gravel, is reached. The sand and gravel are separated from the ore by passing a stream of water through the whole materials. The ore so obtained is preserved in heaps, and smelted periodically with charcoal in a blast furnace. The mine or pit is kept clear of water by the Chinese wheel. No cattle are used in any part of the

process, human labor being had recourse to throughout the whole of its stages. The most imperfect part of the process is the smelting. The stream ores of Cornwall, which are generally poor, afford from 65 to 75 per cent. of grain tin; whereas, owing to the imperfection of the process, from those of Banca not more than 55 or 60 are usually obtained. The difference in the produce suggested, a few years ago, the practicability of sending the ore to England for the purpose of being smelted; and the experiment was tried; but our customs regulations not allowing the produce to be bonded and re-exported without duty, rendered the scheme abortive.

With very trifling exceptions, the whole tin of the Malay islands is mined and smelted by Chinese settlers; and before their skill and enterprise were applied to its production, the metal seems to have been obtained by the inhabitants of the countries which produced it, by processes hardly more skillful than those by which the precious metals were procured by the native inhabitants of America prior to the introduction of European skill and machinery. The following estimate has been given of the annual produce of the principal states and places producing tin:

EAST COAST OF THE MALAY PENINSULA.

	Piculs.
Junk Ceylon	5,000
Queda	2,000
Pera	3,000
Salangore	3,000
Malacca	4,000
Total piculs	17,000

WEST COAST OF THE MALAY PENINSULA AND ISLANDS.

	Piculs.
Sungora and Patani	3,000
Tringanu	7,000
Pahang	3,000
Singkep	5,000
Banca	25,000
Total piculs	53,000

This can be considered only as a rough estimate; but we believe it is not far wide of the truth. The most considerable port of exportation is Batavia; from which there is sent annually, either directly or through orders from the Dutch government or the authorities at Banca, 2000 tons. From Prince of Wales Island there is also a considerable quantity exported; and a smaller one direct to China in junks, from several of the native ports on the eastern shore of the Malay peninsula. The great marts for the consumption of tin are China, Hindostan, and the continent of Europe. The quality of the different descriptions of Malay tin, although there may be some inconsiderable difference in the quality of the original ores, seems to be derived chiefly from the greater or less skill with which the process of smelting is conducted; and this, again, necessarily depends upon the extent of capital and goodness of the machinery employed. The mining operations of Banca have long been conducted upon a larger scale, and with more skill, than in any other of the Malay countries; and, consequently, the metal produced in this island is superior by from 10 to 12 per cent. in the market of Canton it is called "old tin," in contradistinction to "new tin," the produce of the other Malay countries. Next, in point of quality, to the produce of Banca, are those of Tringanu and Singkep, which are not more than 5 per cent. inferior to it. The tin of the state of Pera, a considerable part of which is produced by the natives themselves, without Chinese assistance, is the worst, and usually about 15 per cent. below that of Banca. The native tin of China is 10 per cent. inferior to that of Banca, and is probably block-tin, like the greater part of that of Cornwall; and, like it, the produce of regular mining operations, and not alluvial. The produce of the Chinese mines is said of late years to have greatly decreased; probably owing to the great increase which has recently taken place in the produce of the Malay countries, and the cheapness and abundance with which

it finds its way to China. It should be added, that of late years, and chiefly owing to the very low price and abundance of German spelter (zinc) in the Indian market, this commodity has occasionally been fraudulently mixed with tin. The Chinese brokers of Canton, however, are sufficiently expert to detect the adulteration; and it is believed that this discreditable practice has lately ceased. The price of tin, taking the market of Singapore as the standard, has fluctuated of late years from 14 to 20 Spanish dollars per picul; equal, at the exchange of 4s. per dollar, to 47s. and 67s. per cwt. At an average of these prices, the annual value of the whole Malay tin will be about £240,000 per annum.—CRAWFORD's *History of the Indian Archipelago*; Dr. HORSFIELD's *MS. Statistical View of the Island of Banca*; *Singapore Chronicle*; *Canton Register*, etc.

Tithes are the tenth part of the increase yearly arising and renewing from the profits of lands, the stock upon lands, and the personal industry of the inhabitants, and are offerings payable to the Church by law. Under the Jewish system, the tenth part of the yearly increase of their goods was due to the priests.—*Numbers*, xviii. 21; *Deut.*, xiv. 22; *Levit.*, xxvii. 30, 32.

In the earliest ages of the Christian Church, offerings were made by its members at the altar, at collections, and in other ways; and such payments were enjoined by decrees of the Church, and sanctioned by general usage. For many centuries, however, they were voluntary. But when the Church had increased

in power, and began to number among its members many who adhered to it because it was the prevailing religion, it was found necessary to enforce certain fixed contributions for the support of the ministers of religion. The Church relied upon the example of the Jews, and claimed a tenth. Meanwhile, the conversion of temporal princes to Christianity, and their zeal in favor of their new faith, enabled the Church to obtain the enactment of laws to compel the payment of tithes. In England, the first instance of a law for the offering of tithes was that of Offa, King of Mercia, toward the end of the 8th century. He first gave the Church a civil right in tithes, and enabled the clergy to recover them as their legal due. The law of Offa was at a later period extended to the whole of England by King Ethelwulph.—PRIDEAUX on *Tithes*; BOHN's *Cyclopaedia*.

Tobacco (Da. *Tobak*; Du. *Tabak*; Fr. *Tabac*; Ger. *Taback*; It. *Tabacco*; Pol. *Tobaka*; Russ. *Tabak*; Sp. *Tabaco*; Arab. *Bujjerbbang*; Hind. *Tumbákú*; Malay, *Tambráco*), the dried leaves of the *Nicotiana tabacum*, a plant indigenous to America, but which succeeds very well, and is extensively cultivated in most parts of the Old World. The recent leaves possess very little odor or taste; but when dried, their odor is strong, narcotic, and somewhat fetid; their taste bitter and extremely acrid. When well cured, they are of a yellowish green color. When distilled, they yield an essential oil, on which their virtue depends, and which is said to be a virulent poison. The leaves are used in various ways; being chewed, smoked, and ground and manufactured into snuff. It is in the last mentioned form that tobacco is principally used in Great Britain; and though the contrary has been often asserted, its use does not seem to be productive of any perceptible bad consequence.

Historical Sketch.—The taste for tobacco, though apparently administering only to a frivolous gratification, has given birth to a most extensive commerce, and been a powerful spur to industry. Being a native of the New World, its introduction into Europe dates only from the early part of the 16th century. Seeds of the plant were sent, in 1560, from Portugal to Catherine de' Medici, by Jean Nicot, the French ambassador in that country, from whom it has received its botanical name. The notion, at one time so general, that the specific appellation tobacco was derived from its having been imported from Tobago, is now universally admitted to be without foundation. Humboldt has shown that tobacco was the term used in the Haytian language to designate the pipe, or instrument made use of by the natives in smoking the herb; and the term, having been transferred by the Spaniards from the pipe to the herb itself, has been adopted by the other nations of the ancient world.—*Essai Politique sur la Nouvelle Espagne*, vol. iii. p. 50, 2d. ed. Tobacco is believed to have been first introduced into England by the settlers who returned, in 1586, from the colony which it had been attempted to found in Virginia, under the auspices of Sir Walter Raleigh, in the preceding year. Harriott, who accompanied this expedition, gives, in his description of Virginia, an account of the tobacco plant, and of the manner in which it was used by the natives; adding, that the English, during the time they were in Virginia, and since their return home, were accustomed to smoke it after the fashion of the Indians, "and found many rare and wonderful experiments of the virtue thereof."—HAKLUIT, vol. i. p. 75. Raleigh, and other young men of fashion, having adopted the practice of smoking, it spread among the English; as it had previously spread among the Spaniards, Portuguese, French, and other continental nations. But it made its greatest progress in England after the foundation of the colony at Jamestown, in Virginia, in 1607. The soil of the colony being found particularly well fitted for the culture of tobacco, considerable quantities were raised and sent

home; and the numerous individuals interested in the colony contributed to introduce that taste for it which was diffused among all classes with astonishing rapidity. James I. attempted, by repeated proclamations and publications, some of them couched in very strong terms, to restrain the use of tobacco. But his efforts had very little effect; and the settlers in Virginia continued to experience a more rapidly increasing and better demand for tobacco than for any other product of the colony. During the earlier part of the reign of Charles I., the trade in tobacco was monopolized by the crown. This monopoly was not, however, of long continuance, and totally ceased at the breaking out of the civil war.

Tobacco plants had been early introduced into England, and were found to answer remarkably well. Their cultivation was, indeed, prohibited by James, and afterward by Charles, but apparently without effect. At length, however, the growing consumption of tobacco having excited the attention of the government financiers, it was seen that, by imposing a duty on its importation, a considerable revenue might be raised; but that, were it allowed to be freely cultivated at home, it would be very difficult to collect a duty upon it. In 1643 the Lords and Commons imposed a moderate duty, for the sake of revenue, on plantation tobacco; but instead of directly prohibiting the use of native tobacco, they burdened it with such a duty as, it was supposed, would occasion its culture to be abandoned. The facility, however, with which the duty was evaded soon satisfied the republican leaders that more vigorous measures were required to stop its cultivation, and consequently to render its importation a source of revenue. Hence, in 1652, an act was passed prohibiting the growth of tobacco in England, and appointing commissioners to see its provisions carried into effect. This act was confirmed at the Restoration, by the act Charles II., c. 34, which ordered that all tobacco plantations should be destroyed. These measures were believed at the time to have been principally brought about by the solicitations of the planters; but their real intention was not so much to conciliate or benefit the latter, as to facilitate the collection of a revenue from tobacco; and, considered in this point of view, their policy seems quite unexceptionable.

Nicotiana Tabacum.—It is thought by some that this plant received its name from Tabasco, a province of Yucatan, New Spain; others say from the island of Tobago, one of the Caribbees; and others that it is derived from Tobasco, in the Gulf of Florida. It was first observed at San Domingo, A.D. 1496; and was used freely by the Spaniards in Yucatan in 1520. Tobacco was first carried to England in the seventh year of Elizabeth, 1565, by Sir John Hawkins; but Sir Walter Raleigh and Sir Francis Drake are also mentioned as having first introduced it in England. According to *Stowe's Chronicle*, it was manufactured only for exportation for some years. The Pied Bull Inn, at Islington, was the first house in England where tobacco was smoked. In 1584 a proclamation of the English government was issued against it. The Star Chamber ordered the duties to be 6s. 10d. per lb., in the year 1614. Its cultivation was prohibited in England by Charles II. The act laying a specific duty on the importation into England was passed 1684. The cultivation was allowed in Ireland about the year 1779. In *Anderson's History of Commerce* we find that the tax was increased, and put under the excise in 1789. Various statutes have been passed by the English government relative to tobacco. The act to revive the act prohibiting the culture of tobacco in Ireland passed 2 William IV. (August, 1831). The act directing that tobacco grown in Ireland be purchased in order to its being destroyed, March 24, 1832. The quantity consumed in England in 1791 was 9,500,000 lbs., and in 1829 about 15,000,000 lbs. In 1840 the

quantity had reached to 40,000,000 lbs. In 1854 the quantity imported into Great Britain was about 35,000,000 lbs., of which 2,710,000 lbs. were manufactured as cigars or snuff, and the rest unmanufactured. —HAYDN.

In some countries tobacco is principally, perhaps, used in the form of snuff; in others it is principally chewed, or again smoked; but, in one form or another, it is every where made use of. So early as 1624, Pope Urban VIII. issued a bull excommunicating those who smoked in churches! The practice of smoking was at one time exceedingly prevalent in England; but during the reign of George III. it was well-nigh superseded, at least among the higher and middle classes, by the practice of snuff-taking. Latterly, however, smoking has been extensively revived among both the rich and the poor.

We quote the following statement as to the universality of the use of tobacco from a learned paper on its "Introduction and Use," in the 22d volume (p. 142) of the *Asiatic Journal*: "In Spain, France, and Germany, in Holland, Sweden, Denmark, and Russia, the practice of smoking tobacco prevails among the rich and poor, the learned and the gay. In the United States smoking is often carried to excess. If we pass to the East, we shall find the practice almost universal. In Turkey the pipe is perpetually in the mouth; and the most solemn conferences are generally concluded with a friendly pipe, employed like the *calumet of peace* among the Indians. In the East Indies not merely all classes, but both sexes, inhale the fragrant steam; the only distinction among them consisting in the shape of the instrument employed, and the species of the herb smoked. In China the habit equally prevails; and a modern traveler in that country (Barrow) states, that every Chinese female, from the age of eight or nine years, wears, as an appendage to her dress, a small silken purse or pocket to hold tobacco and a pipe, with the use of which many of them are not unacquainted at this tender age. This prevalence of the practice at an early period among the Chinese is appealed to by M. Pallas as an evidence that 'in Asia, and especially in China, the use of tobacco for smoking is more ancient than the discovery of the New World.' He adds: 'Among the Chinese, and among the Mongol tribes who had the most intercourse with them, the custom of smoking is so general, so frequent, and has become so indispensable a luxury; the tobacco purse affixed to their belt so necessary an article of dress; the form of the pipes, from which the Dutch seem to have taken the model of theirs, so original; and, lastly, the preparation of the yellow leaves, which are merely rubbed to pieces and then put into the pipe, so peculiar, that they could not possibly derive all this from America by way of Europe; especially as India, where the practice of smoking is not so general, intervenes between Persia and China.' This, however, is a very doubtful proposition. It seems sufficiently established that the tobacco plant was first brought from Central America (see date of introduction of tobacco), and it is most probable that it was thence carried to Siam, China, and other Eastern countries. The names given to it in all the languages of the East are obviously of European, or rather American, origin; a fact which seems completely to negative the idea of its being indigenous to the East.

Tobacco is extensively cultivated in Mexico, but only for home consumption. It might probably, however, were it not for the restrictions under which it is placed, form a considerable article of export from that country. Under the Spanish government, the tobacco monopoly was one of the principal sources of revenue; yielding from 4,000,000 to 4,500,000 dollars, exclusive of the expenses of administration, amounting to about 800,000 dollars. No tobacco was allowed to be cultivated, except in a few specified places. Commissioners, or *guardas de tabaco*, were appointed, whose duty

it was to take care that all tobacco plantations without the privileged districts should be destroyed. The government fixed the price at which the cultivators of tobacco were obliged to sell it to its agents. The sale of the manufactured tobacco was farmed out; and cigars were not allowed to be sold, except at the royal *estancos*. No one was allowed to use cigars of his own manufacture. This oppressive monopoly was established in 1764. It has been continued, from the difficulty of supplying the revenue which it produces, by the revolutionary governments.—HUMBOLDT, *Nouvelle Espagne*, iii. 49; POINSETT'S *Notes on Mexico*, note 116, London ed.

Cuba is celebrated for its tobacco, particularly its cigars. These consist of the leaves, formed into small rolls, for the purpose of smoking. Formerly their importation into England was prohibited; but they may now be imported on paying an exorbitant duty. Havana cigars are usually reckoned the best. Previously to 1820, the cultivation and sale of tobacco were subjected to the same sort of monopoly in Cuba as in Mexico; but at the period referred to the trade was thrown open. In consequence of the freedom thus given to the business, the production and exportation of tobacco are both rapidly increasing, though hardly, perhaps, so much as might have been expected, the culture of sugar and coffee being for a while reckoned more profitable; that, however, is no longer the case.—See CUBA for Exports.

United States.—Previous to the war of Independence, its culture had spread into Maryland, Carolina, Georgia, and Louisiana, from which nearly all Europe was supplied; but at present most of the sovereigns of the Old World derive a considerable part of their revenue from the cultivation of this plant. Independent of its production in the Middle and Southern States of the Union, tobacco is extensively cultivated in Mexico, the Spanish Main, Cuba, Brazil, Trinidad, San Domingo, Turkey, Persia, India, China, Australia, the Philippines, and Japan. It has also been raised with success in nearly every country in Europe, Egypt, Algeria, the Cape of Good Hope, the Canaries, and numerous other islands in the ocean, Canada, New Brunswick, and on the western coast of America. The principal varieties cultivated in the United States are the Virginian, the large-leaved, the dwarf, the Cuba, and the common green tobacco.

In 1622 there were raised in Virginia 60,000 lbs. The amount exported from that colony in 1639 was 120,000 lbs.; annually for ten years preceding 1709, 28,868,666 lbs.; annually for several years preceding the Revolution, 55,000 hogsheads; in 1758, 70,000 hogsheads; from North Carolina, in 1756, 100 hogsheads; from Georgia, in 1772, 176,732 lbs. The amount exported from the United Colonies in 1772 was 97,799,263 lbs.; in 1780, 17,424,267 lbs.; from the United States, in 1787, 99,041,000 lbs.; in 1791, 101,272 hogsheads, 81,122 lbs. manufactured, and 15,689 lbs. of snuff; in 1800, 78,680 hogsheads, 457,719 lbs. manufactured, and 41,453 lbs. of snuff; in 1810, 84,134 hogsheads, 495,427 lbs. manufactured, and 46,640 lbs. of snuff; in 1820-'21, 66,858 hogsheads, 1,332,949 lbs. manufactured, and 44,552 lbs. of snuff; in 1830-'31, 86,718 hogsheads, 3,639,866 lbs. manufactured, and 27,967 lbs. of snuff; in 1840-'41, 147,828 hogsheads, 7,503,644 lbs. manufactured, and 68,553 lbs. of snuff; in 1850-'51, 95,945 hogsheads, 7,235,358 lbs. manufactured, and 37,422 lbs. of snuff.

According to the census returns of 1840, the amount of tobacco raised in the United States was 219,163,319 lbs.; of 1850, 199,752,646 lbs.; showing a decrease in its culture of 19,410,673 lbs.

Great Britain.—It is assumed by British statisticians that the yearly consumption of tobacco in Great Britain and Ireland amounts to 26,000 tons; about one half of which, it is supposed, is smuggled, owing to the excessive duties (upward of 1000 per cent.) levied on

the article under the tariff system of that kingdom. The quantity of cigars and snuff imported does not exceed two or three hundred weight per annum. The following table, compiled from parliamentary returns, shows the imports of tobacco into the United Kingdom, and the quantities entered at each port, during the year 1850:

Ports.	Leaf.	Manufactured and Cigars.	Total.
	Tons.	Tons.	Tons.
London	7,638	482	8,120
Liverpool	6,870	146	7,016
Bristol	435	...	435
Glasgow	414	7	421
Leith	200	...	200
Southampton	140	55	195
Other places	3	4	7
Total	15,700	694	16,394

The following return, transmitted to the House of Commons, for the year ending January 5, 1853, shows the annual consumption of tobacco in the United Kingdom, and duty levied on the same:

Ports.	Leaf.	Manufact'd and Cigars.	Total.	Duty.
	Tons.	Tons.	Tons.	Dollars.
London	4,762	69	4,831	8,764,940
Liverpool	2,765	8	2,763	4,903,160
Bristol	730	..	730	1,377,425
Glasgow	651	1	652	1,111,805
Dublin	604	..	607	1,077,835
Belfast	877	..	877	665,555
Newcastle	341	..	341	602,220

* There were also exported cases and bales, included in the column of value.

The duties on imported tobacco yield to the British government over four and a half millions sterling an-

nually. For the fifty years, from 1801 to 1850, the aggregate duties collected amounted to the enormous sum of one hundred and fifty million pounds sterling! We annex the quantities imported, and the duties, at intervals of five years:

Years.	Pounds consumed.	Duty paid.
1801.....	16,904,000	£1,209,000
1805.....	16,815,000	1,391,000
1810.....	20,328,000	2,043,000
1815.....	17,965,000	2,604,000
1820.....	15,716,000	3,117,000
1825.....	13,761,000	3,258,000
1830.....	19,293,000	2,924,000
1835.....	21,116,000	3,354,000
1840.....	23,006,000	3,616,000
1845.....	26,161,000	4,245,000
1850.....	27,734,000	4,660,000

The changes in the import duties were as follows:

Years.	American.	Spanish or Portuguese.
1801-'2.....	1 7	4 6
1803.....	1 7	4 8½
1804.....	1 8½	4 10½
1805.....	1 9½	4 11

1833.....	2 9	3 0
1842.....	3 0	3 0

We have no means of ascertaining the value of cigars smoked away in the United States annually.

Baden.—The cultivation of tobacco in the Grand Duchy of Baden was commenced in the early part of the present century. It has greatly increased within the last twenty years; and particularly so since the commencement of the exportation of *palatinate cigars* to the United States, and which export trade during the last twelve years has shown a constantly augmenting importance. In the Grand Duchy there are now from 18,000 to 20,000 acres of land devoted to the cultivation of tobacco. It is particularly the Baden palatinate which yields the most and best; but the cultivation extends to other parts, and even as far as Offenbourg, in Breisgau. The crops of five years differed very much from each other in regard to quantity, and still more in quality. The last two crops were superior to all others.

The crops of 1851 were.....	100,000 cwt.
" 1852.....	200,000 "
" 1853.....	160,000 "
" 1854.....	150,000 "
" 1855.....	170,000 "
" 1856.....	180,000 "

The cultivation and produce of the Pfalz (Rhenish Bavaria) amounts to about half of that of Baden. As compared with other crops, the cultivation of tobacco would appear to the traveler to be on very large plantations, but the vast extent of tobacco ground in some parts of the Badish palatinate (as near Seckenheim, where they reach for miles) belong to hundreds of different persons, generally speaking, in the Baden and Bavarian palatinates; tobacco is cultivated only in detached and small pieces of ground; some few of the principal land-owners raise from 150 to 200 cwt. per annum; some not more than 5 cwt.; and others, again, not more than 3, and even down to 2 cwt. The tobacco is not put up in hogsheds, as in America; it is put up in strong bales. The finer sorts and *leaf* are put up in boxes, and exported to Spain, England, etc. Common tobacco for inland consumption is mostly sold and dispatched in a loose state.

From 1844 to 1852 the prices of tobacco, with a few exceptions, remained about the same; the lowest at 7½ florins, and the highest 15 florins, per 50 kilograms. During the years 1852-'53 the export of cigars, principally to the United States, had become so great as to make the cigar manufacturers early and important purchasers. Large purchases were also made for the

régies of France and Austria. The latter alone bought 100,000 cwt., which, of course, produced a great rise in the market; prices went up from 12 florins to 25 florins per 50 kilograms; and since that period tobacco, like cotton and public funds, has become an article of "speculation."

The average prices for the last five years may be quoted as follows:

Say for 1851.....	12 to 22 florins per 50 kilograms.
" 1852.....	7 to 18 " " "
" 1853.....	10 to 14 " " "
" 1854.....	12 to 25 " " "
" 1855.....	10 to 30 " " "
" 1856.....	13 to 42 " " "

The whole of the last crop was disposed of before the close of the year. Between Carlsruhe and Bruchsal the prices were from 16 to 23 florins. The first-rate tobacco of the palatinate was sold from 33 to 42 florins per 50 kilograms. According to estimate, about one half of the produce is manufactured, and the other half exported to England, Spain, and Switzerland, and to Austria and France. It is quite clear that the growing of tobacco is profitable; for it is known that on an average it costs the planter not over 12 florins per 50 kilograms; and in further evidence of the fact is the constantly increasing breadth of land devoted to the cultivation of that crop. The consumption of foreign tobacco in the Grand Duchy can not be correctly ascertained, there being no statistical account of it, but I have heard the quantity estimated at 25,000 cwt. per annum.

The present high prices of tobacco, in the face of good crops, are caused in a great measure by the active export demand. The shippers of cigars to America, and who have now mostly their own manufactories, are large and ready purchasers, and for the best kinds pay high prices. The Austrian *régie* is a very important customer, and the French *régie* early last fall contracted with some of the Baden cigar manufactories for 100,000,000 of cigars. The improved export trade has increased the demand for tobacco of foreign growth. In Baden and Rhenish Bavaria there are no other taxes on the cultivation of tobacco except land and ground taxes, while the duty on foreign tobacco is,

On raw tobacco.....	7 florins per 50 kilograms.
On manufactured tobacco.....	19½ " " "
On cigars.....	85 " " "

—United States Com. Relat.

France.—The revenue derived from the tobacco monopoly in France, during the first nine months of 1857, reaches the enormous sum of 127,223,000 francs, or about \$25,444,600—showing an increase over the revenue derived from the same source the corresponding period of 1856 of 7,488,000 francs, or \$1,497,600. The increase is owing to the larger consumption of tobacco in France, and would seem to indicate a steady market for the article in the leading countries of Europe. The tobacco monopoly, under the *régie* system, commenced in France in the year 1811. The following statement will show the amount of revenue derived from this article in quinquennial periods from that date:

1811.....	\$1,200,000	1841.....	\$14,397,819
1816.....	6,671,064	1846.....	17,112,216
1821.....	8,455,801	1851.....	18,446,746
1826.....	9,993,611	1856.....	19,068,816
1831.....	9,184,156	9 months 1856.....	23,947,000
1836.....	11,125,908	9 months 1857.....	25,444,600

The United States supplies about two-fifths of all the tobacco consumed in Europe, and usually from three-fourths to four-fifths of all the tobacco consumed in France. Were the monopoly abolished, and our tobacco admitted at a moderate duty, our exports of the article to France would increase at least ten-fold. The average price of American tobacco delivered at the factories of the *régie*, all expenses included, is estimated as follows:

Maryland tobacco.....	9-5 cents per lb.
Virginia.....	8-2 " "
Kentucky.....	7-7 " "
Missouri.....	7-5 " "

The profits realized by the *régie*, one year with another, average nearly 450 per cent.

Netherlands.—The cultivation of tobacco in the Netherlands is subject to no restrictions, with the exception of the excise duty, to which, like all other products, it is liable. From 1800 to 1900 morgens (equal to 3600 to 3800 acres) are annually devoted to tobacco. The tobacco land is situated in the provinces of Guiderland, Overysseel, Utrecht, and Zealand. The average quantity of tobacco produced on each morgen is about 4500 lbs. The total crop is estimated at from 8,000,000 to 9,000,000 lbs. per annum.—*Annales du Commerce Extérieur*, No. 540. The quantity reserved for home consumption is about 2,000,000 lbs., of which,

Smoking tobacco, about	900,000 lbs.
Snuff	700,000 "
Covers for cigars	400,000 "

Besides the above, the Netherlands export to foreign countries about 6,000,000 lbs. of tobacco:

In the leaf	5,000,000 lbs.
Manufactured	1,000,000 "

The following table shows the annual tobacco export of Holland:

The Rhenish provinces	580,000 kilograms.
Russia and Great Britain	400,000 "
Sardinia	250,000 "
Norway and Denmark	80,000 "
Naples	50,000 "
Roman states	50,000 "
Spain and Portugal	80,000 "

The total quantity of tobacco grown in the Netherlands is distributed as follows:

	Kilograms.
For the manufacture of snuff and chewing tobacco	1,875,000
For cigars and cigar covers	1,775,000

Average price of the former, from 14 to 32 florins for common; 80 to 90 florins for the best, per 100 kilograms. Average price of the latter, from 14 to 32 florins for common; 60 to 90 florins for the best, per 100 kilograms. The planters of Arnhem, and some other districts, have during the past few years applied themselves to the raising of a very light, clear, yellow tobacco, for cigar covering, for which they obtain a very high price. For this purpose they employ a very active fertilizer, with a view to the large and rapid growth of the plant, which they dry by the sun with great skill and management. The average quantity of foreign tobacco annually imported is from 22,000,000 to 25,000,000 lbs., chiefly from the following places:

Maryland.....	5,600,000 kilo.	Varinas.....	120,000 kilo.
Kentucky.....	1,750,000 "	Manilla.....	75,000 "
Virginia.....	1,400,000 "	Colombia.....	30,000 "
Java.....	800,000 "	Brazil.....	30,000 "
Porto Rico.....	360,000 "	Havana.....	60,000 "
Cuba.....	180,000 "	Tobacco stems	145,000 "
San Domingo.....	120,000 "		

A third part of the tobacco imported from foreign countries is consumed in the Netherlands, the other two-thirds are exported. Germany and Belgium receive the larger portion, which consists altogether of Virginia, Maryland, Kentucky, and some Java tobacco. Besides the imports above designated, Hamburg supplies Holland annually with large quantities of tobacco of American growth. The tobacco manufactories in Holland, of the first class, are numerous. They are chiefly located at Rotterdam and Amsterdam, though many similar factories are scattered throughout the provinces. The first-class factories employ upward of a million of operatives. The average consumption of tobacco in Holland is about two kilograms (4·408 lbs.) for each individual, or 6,000,000 kilograms, or upward of 13,000,000 lbs. for the whole population. Germany offers the principal market for the Dutch tobacco trade, though considerable quantities are exported to the Levant, Italy, Austria, Belgium, Denmark, Surinam, etc.—C. D.

Tobacco is, next to salt, probably the article most universally consumed by men. In one form or an-

other, but most generally in the form of fume or smoke, there is no climate in which it is not consumed, and no nationality that has not adopted it. To put down its use has equally baffled legislators and moralists; and, in the words of Pope on a higher subject, it may be said to be partaken of "by saint, by savage, and by sage." The civilized European and American nations are the smallest consumers of tobacco of any people, in consequence of its being every where with them an object of heavy taxation, of its being very generally a foreign commodity or high-priced, because raised in uncongenial climates, and, finally, its being for the most part confined in use to the male sex.

The duty on the importation of *raw tobacco* amounts,

In the United States to...	30 per cent. ad valorem.
In Belgium to.....	15-0 "
In Great Britain to.....	93-3 "
In Hanover to.....	9-6 "
In Holstein to.....	10 "
In Holland to.....	3-5 "
In Russia to.....	161 "
In Switzerland to.....	8 "
In Zoll-Verein to.....	45 "

—German Custom Union.

Statement "respecting the Tariff Duties, Restrictions, Prohibitions, and Custom-house Regulations applicable to American Tobacco, in the principal commercial Countries of Europe."

BREMEN levies a Tariff Duty of $\frac{3}{4}$ of 1 per Cent.—Import duty is levied at the rate given on the invoice value, with the addition of freight and insurance charges. All foreign vessels (American excepted) must be entered at this port by a licensed ship-broker, the exemption in favor of American vessels having been conceded by the Bremen Senate in 1852.

GREAT BRITAIN levies a Duty of 72 Cents per lb., and 5 per Cent. additional.—Tobacco, snuff, and cigars are prohibited to be imported into Great Britain, unless in vessels of not less than 120 tons burden, and into ports approved by the commissioners of customs. These ports are London, Liverpool, Bristol, Hull, Lancaster, Cowes, Falmouth, Whitehaven, Plymouth, Newcastle, Southampton, Preston, and Swansea, in England; Aberdeen, Leith, and Greenock, in Scotland; and Dublin, Belfast, Galway, Limerick, Londonderry, Newry, Sligo, Waterford, Wexford, and Drogheda, in Ireland. Duties alike from all countries and in all bottoms. The consumption of tobacco in the United Kingdom was:

Years.	Consumption.	Revenue.	Population.	Consumption per head.
	Pounds.	£		Ounces.
1821	15,838,152	3,192,583	21,282,960	11·71
1831	19,533,841	2,964,592	24,410,439	12·80
1841	22,300,360	3,580,163	27,019,672	13·21
1851	28,062,978	4,485,768	27,452,262	16·86

In 1853 the duty amounted to £4,751,780, or \$23,000,000.

FRANCE.—*Tobacco a Government Monopoly.*—In 1629 the first duties on the tobacco trade were levied. In 1674 Louis XIV. established the first monopoly in Europe. The cultivation of tobacco is prohibited except in six departments. From 1811 to 1852 there were sold by the government 1,308,838,075 lbs., which brought a clear revenue of \$432,233,434. The expenses of the administration were 24 per cent. *ad valorem*. By the terms of the treaty of June 24, 1822, American produce, if imported direct to France in United States bottoms, is admitted on the payment of the same duties as apply to similar importations from countries out of Europe in French vessels. The origin of the merchandise must, however, be duly authenticated and certified by the collector at the port of exportation, and by the French consul. American tobacco is purchased by the commissioners of the *régie* for the government factories, and is admitted either in French or American vessels free of duty. In foreign vessels the duty is \$1·86 per 100 kilograms (221 lbs.).

The monopoly was established in 1810 by imperial decree.

HOLLAND levies a Duty of 28 Cents per 221 lbs.—If imported direct from the United States, admitted on the same terms, whether in American or national vessels.

SPAIN.—*Tobacco is a Government Monopoly.*—The gross receipts from the tobacco monopoly in the years 1830-'34 were \$4,950,121, and the net receipts \$3,097,147. The sold tobacco amounted to 2-4 lbs. per head of the population. The net receipts of 1851 were \$3,100,000. The expenses of the administration amounted to 40 per cent. of the total value. Admitted at the port of Malaga in American vessels at a duty of 20 cents, and in Spanish at a duty of 15 cents per lb. The privilege of the tobacco monopoly in Spain is rented to individuals, and yields a revenue of about \$4,000,000 to \$6,000,000 per annum.

BELGIUM levies a Duty of \$1 86 per 221 lbs.—In the direct trade between the United States and Belgium the vessels of both nations are equalized by treaty. In the indirect or triangular trade there are discriminations, though frequently suspended by Belgium.

SARDINIA.—*A Government Monopoly.*—The annual revenue can not be calculated, as the Italian states are grouped in official returns of commerce.

AUSTRIA.—*A Government Monopoly.*—The monopoly exists since 1784. The gain of the government amounts to 76 per cent. *ad valorem*. The net receipts amounted in 1851 to \$8,739,421, and in 1853 to \$10,619,106. The consumption in the whole empire was, in 1850, 84,457,513 lbs.; in 1851, 54,217,578 lbs.; in 1852, 61,805,697 lbs.; in 1853, 57,926,925 lbs.; in 1854, 62,020,333 lbs. When imported by permission of the government, the duty is \$4 85 per 110 lbs., besides 97 cents per lb. for a license to import.

SWEDEN levies a Duty of 5 5-6 per lb.—The duty is over 100 per cent., and importations from the United States are diminishing annually.

NORWAY levies a Duty of 4½ cents per lb.—Owing to a difference in the weights and measures in use in Norway, the duty is about 33-3 per cent. less than in Sweden.

PORTUGAL.—*A Government Monopoly.*—The raw article for the factories of the government is derived chiefly from Brazil, about half a million lbs. per annum being received from the United States.

STATEMENT EXHIBITING THE QUANTITIES OF AMERICAN TOBACCO EXPORTED FROM THE UNITED STATES INTO THE COUNTRIES DESIGNATED, WITH THE AMOUNTS OF DUTIES PAID THEREON, DURING THE COMMERCIAL YEAR 1855.

Countries.	Quantities.	Duties paid.
Bremen	38,068,000 lbs.	\$16,652.
Great Britain	24,203,000 "	\$18,297,468.
France	40,866,000 "	Average annual revenue from monopoly, \$16,000,000.
Holland	17,124,000 "	\$21,695,000.
Spain	7,524,000 "	Average annual revenue from monopoly, \$4,600,000.
Belgium	4,010,000 "	\$33,749.
Sardinia	3,311,000 "	No data from which to ascertain amt. of revenue derived from monopoly.
Austria	2,945,000 "	\$129,805, besides an annual profit to the <i>régie</i> of about \$7,500,000.
Sweden and Norway	1,713,000 "	\$88,505.
Portugal	336,000 "	No data from which to ascertain the share of the monopoly revenue which this quantity bears; the whole amount is about \$2,250,000 yearly.

The total receipts from custom duties in France for one year (1848), according to official returns, were 146,000,000 francs, of which 86,000,000 were derived from tobacco, nearly all grown in the United States.

The Austrian empire contains 36,514,397 inhabitants. The annual yield (average) of tobacco in Austria is estimated at 79,000,000 lbs. The only places where the plant is permitted to be grown are Hungary, Galicia, the Tyrol, and Venice. In Hungary it is the leading staple, the annual crop reaching as high as 68,000,000 lbs. Of this one-third is sold to the Austrian *régie*, one-third to foreign countries, and the remaining third is consumed at home. The average annual importation from the United States is from two and a half to three millions of lbs. The *régie* clears a profit of 10 cents on each lb. of raw tobacco, and the annual revenue to the government is \$7,500,000.

In the states composing the Zoll-Verein the annual crop of tobacco is estimated at 55,000,000 lbs. The revenue derived from American tobacco is about \$1,800,000 per annum. The duty on raw tobacco is \$2 76 per 110 lbs., which, if re-exported, enjoys a drawback of \$2 20 per 110 lbs. Tobacco grown within the limits of the Customs Union pays only 46 cents for the same quantity. The revenues which the government herefrom derives amount to 38 per cent. on the value.

Belgium produces annually about 1,300,000 lbs. of tobacco, and imports from 9,000,000 to 11,000,000 lbs.

Holland produces from 4,000,000 to 5,000,000 lbs., and imports annually from 30,000,000 to 35,000,000 lbs. The tobacco factories in this country are stated to give employment to "one million operatives."

Bremen imports yearly from 35,000,000 to 50,000,000 lbs. of tobacco, most of which is manufactured in that city and re-exported to foreign markets.

Hamburg imports only from 1,000,000 to 2,000,000 lbs. annually, most of which, after being manufactured, is re-exported.

The annual tobacco crop of Russia is about 25,000,000 lbs.

The annual consumption of tobacco in Spain is about 9,000,000 lbs., one-third of which is imported for the government factories from the United States.

In Portugal the culture of tobacco is prohibited by law.

The quantity of American unmanufactured tobacco annually imported into the principal commercial countries of Europe may be thus stated: For each inhabitant of Great Britain, 14 ounces; for each inhabitant of France, 10 ounces; for each inhabitant of Belgium, 2½ lbs.; for each inhabitant of Holland, 2½ lbs.; for each inhabitant of the Hanse Towns, 5 lbs.; for each inhabitant of Hanover, 8½ lbs.; for each inhabitant of Mecklenburg Schwerin and Mecklenburg Strelitz, 2 lbs.; for each inhabitant of the states of the Zoll-Verein, 1 lb.; for each inhabitant of Russia, ½ ounce; for each inhabitant of Austria, 1 ounce; for each inhabitant of Spain, 3 ounces; and for each inhabitant of Portugal, 1½ ounce. The aggregate quantity of tobacco annually raised in these countries (exclusive of their colonies) is about 210,000,000 lbs. The aggregate quantity of tobacco raised in the United States in 1850 was 199,752,515 lbs.—*Census of 1850.*

The average annual quantity of American tobacco imported into Great Britain during a period of three years (1851, '52, '53) was 24,543,334 lbs., on which there was levied an average annual duty of \$13,554,760. The average annual quantity imported into France during the same period was 14,690,000 lbs.; into Holland, 18,660,000 lbs., on which the average annual amount of duty was \$24,915; into Belgium, 4,824,000 lbs., on which the average annual amount of duty was \$40,600; and into the Hanse Towns, 38,687,667 lbs., on which was paid an average annual amount of \$12,643 91.

The following table shows the average consumption per head of male population over 18 years of age; also net revenue from tobacco, and tax per head of population. It will be seen that the countries Steuer-Verein, Zoll-Verein, and Belgium, in their respective order, are the largest consumers per head of tobacco; and

that England, the Papal States, and Spain, in their order, produce the greatest net revenue per head:

Countries.	Average Consumption.	Net Revenue.		Per Head.
	Pounds.	Dollars.	Cents.	
Austria	6-75	6,062,650	26 1-3	
Zoll-Verein	9-75	1,482,800	5 1-2	
Steuer-Verein (Han- over and Oldenburg, now added to former)	12-50	62,100	3 1-20	
France	5-50	15,291,780	45	
Russia	2-50	1,421,400	2 1-3	
Portugal	3-50	1,520,700	46 2-3

United States*	7-00			

—Cor. Nat. Intelligencer.

* Hypothetically.

According to the United States Census Report, the number of lbs. of tobacco in the year 1850, produced per acre, was as follows: Kentucky, 575 lbs.; Maryland, 650 lbs.; Missouri, 775 lbs.; Ohio, 730 lbs.; Tennessee, 760 lbs.; Virginia, 660 lbs. The whole number of acres for cultivation of tobacco at the same time was 400,000, which at an average of 600 lbs., five acres would produce 240,000,000 lbs. annually. The gross product for the same year was estimated to be worth \$13,982,686, being about one half the duty levied on Great Britain on 27,000,000 lbs. only. Every State in the Union produces tobacco more or less. Delaware, Maine, Rhode Island, and Vermont produce so little that it was not enumerated in the year 1850.

THE TOBACCO TRADE OF THE UNITED STATES.

IMPORTS OF TOBACCO INTO THE UNITED STATES FOR THE YEARS ENDING JUNE 30, 1853, '54, '55.

	Raw State.		Snuff, etc.		Cigars.

Agreeably to official statements received at the State Department at Washington, the annual average produce of the States of Maryland, Ohio, Virginia, Tennessee, Kentucky, and Missouri, is estimated at 200,000 hogsheds, of 1200 lbs. each, of which foreign countries annually take 162,000 hogsheds, leaving about 40,000 per annum for our home consumption, which are manufactured into fine cut, smoking, and

chewing, plug chewing tobacco, and snuff. But a very small quantity is now used of these crops for the making of cigars, as the manufacturing of common grades of cigars has almost entirely ceased in this country, for reasons which will be stated hereafter. The average crops of the last few years have been under the above estimate, the exportations smaller, the home consumption for the above uses somewhat larger; and foreign consumers of these kinds have been compelled to substitute other foreign tobaccos, not as desirable to them as our produce, to supply the deficiencies in our deliveries. Thus it will be perceived that of the largest product of tobacco of our own growth but one-fourth is required to supply the home demand, while, if the production could be doubled, foreign countries would be ready customers for the greatest part of it, as our tobacco leaf is of such peculiar style and quality, that, like cotton, or the leaf tobacco of the island of Cuba, it is indigenous to the soil and climate, no other soil producing the same; and therefore its culture is confined to certain sections of the country, and attempts in others have proved unsuccessful. Besides the above described sorts of leaf tobacco, five States of the Union produce a limited quantity of leaf, mostly used for the manufacture of cigars, namely, Connecticut, New York, Ohio, Pennsylvania, and Florida. The average yield in these States has been of late years as follows:

In Connecticut.....	5,000 cases of 350 lbs. each.
In New York.....	2,000 " " "
In Ohio.....	5,000 " " "
In Pennsylvania.....	2,000 " " "
In Florida.....	2,000 " " "
Total.....	16,000 " " "

Deduct from the above one quarter, or 4000 cases, of the most inferior grades, called fillers, and now used mostly for the cutting of smoking tobacco, and it leaves 12,000 cases, or about 4,000,000 lbs. for the use of the cigar-maker. In former years, about one-third of these crops were bought for exportation, chiefly by German buyers; but for the last few years the consumption for the manufacture of cigars has so considerably increased, that of the produce of the first four States very little is exported—our manufacturers paying higher prices than exporters are willing to give; and only of the crop of Florida, about one-half to two-thirds is annually exported, leaving from three to three and one half millions of lbs. of leaf of our own growth, called Spanish seed-leaf tobacco, for the home consumption of the cigar manufacturers.

The manufacturing of cigars, at prices to rival the foreign fabric, having become next to impossible, a great many operatives, who made fair wages for their own and their families' support, were forced, in consequence, to turn to other employments, particularly so in Pennsylvania and Connecticut. Other manufacturers gave their attention to better grades of cigars, for the purpose of furnishing a medium between the common German and finer and high-priced Havana cigar. The American cigar-makers, being noted for their excellent workmanship and tasty style of packing, succeeded in furnishing an article as handsomely made as the fine Havana, similar to it in appearance and flavor, although not of as fine a quality, at a more moderate price than the latter, as palatable to the great majority of smokers, who are disinclined to use the common German fabric, and, finding the genuine Havana too expensive, content themselves with the fair medium, and thus became the great patrons of this branch of trade. This class of cigars are made from our own seed leaf and Florida tobacco for wrappers, and from Havana, Sagua, Cuba or Yara (all the produce of the island of Cuba), for fillers, and now the consumption of this sort reaches 300 to 400 millions of cigars a year, varying in prices from \$12 to \$22 per thousand. From 1848 to 1851, five thousand cases of seed-leaf wrappers annually were sufficient to supply the wants of the cigar-makers for home use; the value

of seed-leaf wrappers ruling at 10 to 15 cents, and fillers 4 to 5½ cents; leaving a large surplus for export, principally to Germany, to be returned to us as a rival of our own offspring in the shape of low-priced German cigars. Since 1852, almost the entire crops of seed-leaf tobacco have been manufactured at home into Spanish cigars—prices for seed-leaf wrappers ranging at 20 to 35 cents, and fillers at 10 to 13 cents per lb., and a corresponding increase in the importation and consumption of its needful concomitant, the Spanish tobacco from the island of Cuba, for fillers, has taken place.

The importations of this sort of tobacco were—

In 1850, 25,000 lbs.; value, \$300,000, duty paid under \$90,000	
In 1851, 23,000 " " " " " " " "	275,000 " " " " " "
In 1852, 35,000 " " " " " " " "	420,000 " " " " " "
In 1853, 35,000 " " " " " " " "	520,000 " " " " " "
In 1854, 42,000 " " " " " " " "	520,000 " " " " " "
In 1855, 45,000 " " " " " " " "	550,000 " " " " " "
In 1856, 40,000 " " " " " " " "	600,000 " " " " " "

To show the extent of the export of leaf tobacco and cigars from Cuba, a large portion of which is imported into this country for cigar manufacture and consumption, we give the following statement:

QUANTITIES OF LEAF TOBACCO AND CIGARS EXPORTED FROM CUBA FROM 1848 TO 1854, BOTH INCLUSIVE.

Years.	Leaf Tobacco.	Cigars.	Years.	Leaf Tobacco.	Cigars.
Pounds.	M.		Pounds.	M.	
1848..	6,276,630	161,450	1852..	9,737,443	142,567
1849..	4,019,133	123,720	1853..	8,039,717	237,350
1850..	7,973,148	212,640	1854..	9,803,150	251,313
1851..	9,436,591	270,313			

From this we see that the exportation of leaf tobacco from Cuba has been steadily increasing, but not in the same proportion with the exports of cigars.

Added to this we give the production of tobacco in the island of Porto Rico, only a small portion of which is imported into and used in this country:

Years.	Pounds.	Years.	Pounds.
1848.....	2,457,449	1851.....	6,478,084
1849.....	2,439,540	1852.....	5,565,739
1850.....	2,973,308	1853.....	3,703,457

The fact has now become incontrovertible, that to sustain this branch of industry, the use of the finer grades of foreign material, to improve the quality of our own product, is indispensable. The census report of 1850 gives the number of tobaccoists and cigar-makers in the United States as 10,233.

It may be here stated, as important to the export trade of tobacco, and as a specimen of the inequalities of the tariff duties on tobacco in Europe, that the Norwegian tariff, which differs in many essential particulars from that of Sweden, admits tobacco considerably lower; and, owing to this fact, and to the advantages resulting from different weights, it is found that tobacco blades may be imported into Norway at a rate nearly 30-3 per cent. less than into Sweden.

The following table exhibits the prices current at Liverpool, December 31, for the years 1855, '56, '57:

—For articles on tobacco, see *American Quarterly Review*, ix. 136; *De Bow's Review*, xii. 656, ii. 249, xi. 394; *Hunt's Merchants' Magazine*, x. 72, xv. 521, xvi. 396. On tobacco trade, see *American Almanac*, 1836.

Tokay, a town of northeast Hungary, county of Zemplin, on the right bank of the Theiss, at the influx of the Bodrog, 43 miles north-northwest of Debreczin. Population, 5700. It is celebrated as being the entrepôt for the famous Tokay wine, produced in the hilly tract called the Hegyalla, in the county of Zemplin, lat. 48° N., between the Bodrog and Hernad rivers. The wine of premier quality is bought up for the imperial cellars, and only the secondary and inferior growths are exported. Much of the wine sold as

Tokay is produced in other parts of Hungary. In manufacturing the genuine Tokay wine, the dried grapes are carefully separated from the others, and three sorts of wine are produced. The best is the *Essence*: this is the oily juice which runs from the fruit without any pressure. When this ceases to run, the grapes are moistened with common Tokay-must, and trodden out: this gives the *Ausbruch*. A second infusion of Tokay-must on the remaining grapes, pressed by hand, gives the *Mászlás* (Masklass).—See HENDERSON on *Wines*; *Ency. Amer.*

Tokens (Bank). These were silver pieces issued by the Bank of England, of the value of 5s., January 1, 1798. The Spanish dollar was at first impressed with a small profile of George III.; it was stamped on the neck of the Spanish king. Tokens were raised to the value of 6s. 6d., November 14, 1811. Bank tokens were also current in Ireland, where those issued by the Bank of Ireland passed for 6s. and lesser sums until 1817. They were soon after called in, on the revision of the British coinage.

Toll, from the Saxon *Tolne*; in German *Zoll* (called in law Latin *Telonium* and *Tolnetum*, with many other variations, which may be seen in Ducange, all which Latin terms are derived apparently from *τελώνιον*, "collection of tribute or revenue"). Tolls may be considered a payment in money, or in kind, fixed in amount, made either under a royal grant or under a prescriptive usage, from which the existence of such a grant is implied, in consideration of some service rendered, benefit conferred, or right forborne to be exercised by the party who is entitled to such payment.

An ancient toll may be claimed by the owner of a port in respect of goods shipped or landed there. Such tolls are port tolls, more commonly called port dues. The place at which these tolls were set or assessed was anciently called the Tolsey, where, as at the modern Exchange, the merchants usually assembled, and where commercial courts were held.—BOHN's *Cyclop.*

Marine tolls were first paid by vessels passing the Stade on the Elbe, A.D. 1109. They were first demanded by the Danes of vessels passing the Sound, 1341. Toll-bars in England originated in 1267, in the grant of a penny for every wagon that passed through a certain manor; and the first regular toll was collected a few years after for mending the road in London between St. Giles and Temple Bar. Tolls were also gathered for repairing the highways of Holborn Inn Lane and Martin's Lane, 1346. Toll-gates or turnpikes were used in 1665. Numerous acts relating to tolls and turnpike roads have been passed in Great Britain and the several States of the United States.—HAYDN.

By order of the London Court of Common Council, the tolls taken at the several bars of the city of London, for the wagons, carts, etc., not being the property of a citizen of London, were abolished December 25, 1854. These tolls had brought an annual revenue of only 2d. on each cart, or about £6000.

Ton, a weight used in Great Britain and this country, usually of 2240 lbs., but sometimes of 2000 lbs., called a short ton. By act of Congress it is decided that, unless specified to the contrary, a ton weight is to be understood as two thousand two hundred and forty lbs. avoirdupois.—See WEIGHTS and MEASURES.

Tonnage, in *Commercial navigation*, the number of tons burden that a ship will carry. Tonnage has long been an official term, intended originally to express the burden that a ship would carry, in order that the various dues and customs which are levied upon shipping might be levied according to the size of the vessel, or rather in proportion to her capability of carrying a burden. It has hence arisen that the term "tonnage," as applied to a ship, has become almost synonymous with that of size. It is, indeed, the only term used to give an idea of the magnitude of merchant ships, which are invariably spoken of according to

their tonnage, or as being ships of 50, of 500, or of 1000 tons. Not only are all dues and customs levied according to tonnage, but ships are also built, and sometimes sold and bought for a price per ton of their admeasurement; and they are also timbered, fastened, and have their anchors, cables, and boats, all in proportion to the same datum. Tonnage, therefore, in so far as these considerations are involved, is assumed to be a correct representation of the size of a ship.

It is evident that tonnage may express several results of measurements, and in each case may be a sufficiently fair criterion of the burden of a merchant vessel by which to levy dues; because all that is required thus far, either on the part of the government or of private interests, or on that of the owner, is, that the dues should be levied in equal proportion on all vessels. Thus, tonnage may be the product of a series of measurements, intended to express the exact size, or an approximation to the exact size of the ship. It may be the actual displacement or weight of the ship, either with or without the cargo; it may be the displacement of the cargo, or the dead weight which she will carry to a fixed draught of water; or it may be the exact capacity of the space which she has for the stowage of cargo. Yet to each of these there are important and practical objections. The first, or that by which the measured bulk of the ship would be the tonnage, might be easily evaded, and would lead to injurious results; because, as there must necessarily be fixed measuring places, such a law would have the effect of restricting vessels to that shape which would carry the greatest amount of cargo under the least possible measurements at these places. If the actual displacement, either load or light, of a vessel were to be her tonnage, it would be subject to the inconvenience that it could only be calculated correctly from the drawing of the ship, and therefore would be inapplicable to foreign ships arriving at our ports. An exact account of the draught of water, either load or light, would also be necessary, which being a variable quantity when the load draught is involved, and one of great difficulty to be determined when the light draught is required, would present almost insuperable objections; and, besides, the draught of water is a quantity easily concealed or falsified for fraudulent purposes. Above all objections, however, may be reckoned this: that if either the load or the ship represent the tonnage, it would be to the interest of the ship-builder to build large vessels with slight scantling and inadequate fastenings, that the weight of the vessel might be small in proportion to that of the cargo. If the tonnage were to express the difference between the two displacements, that is, the excess of the load displacement over the light, or the dead weight of the loading, although this would be the most correct in principle, and even mathematically correct, there is the objection that it involves a knowledge of both light and load draughts of water, and is therefore, on this account, practically, at least, as objectionable as the whole displacement. Lastly, if the tonnage were to be the space or capacity for the stowing of cargo, numerous openings would be afforded for fraudulent evasion; because the manner of measuring the ship for this space must be defined, and it is easy to build space which will not come within the limits of the defined measurements; or it is easy to build a vessel of such a form that the measurements made at given points shall not give a correct account of her capacity.

Measurement of Tonnage in the United States.—By an act of Congress, passed March 2, 1799, it is provided that, to ascertain the tonnage of any ship or vessel, the surveyor, or such other person as shall be appointed by the collector of the district to measure the same, shall, if the said ship or vessel be double-decked, take the length thereof from the fore part of the main stem to the after part of the stern-post above the upper deck, the breadth thereof at the broadest

part above the main wales, half of which breadth shall be accounted the depth of such vessel; and shall then deduct from the length three-fifths of the breadth, multiplying the remainder by the breadth, and the product by the depth, and shall divide this last product by ninety-five, the quotient whereof shall be deemed the true contents or tonnage of such ship or vessel. And if such ship or vessel be single-decked, the surveyor, or other person authorized, shall take the length and breadth as above directed, in respect to a double-decked ship or vessel, shall deduct from the said length three-fifths of the breadth, and, taking the depth from the under side of the deck plank to the ceiling in the hold, shall multiply and divide as aforesaid, and the quotient shall be deemed the tonnage of such ship or vessel.

METHODS AT PRESENT IN USE AMONG FOREIGN NATIONS FOR COMPUTING THE TONNAGE OF SHIPS.

FRANCE.—The three measures of length, breadth, and depth are multiplied together, and the product is divided by 94 for the tonnage.

In single-decked vessels the length is taken from the after part of the stem on deck to the stern-post; the extreme breadth is taken, being measured inside from ceiling to ceiling, and the depth from the ceiling to the under surface of the deck.

In vessels of two decks, at Bordeaux, the length of the upper deck and that of the keelson is measured, and the mean taken for the length. But at Brest, Marseilles, and Boulogne, the mean of the length on the two decks, from the stem to the stern-post, is taken as the length. The depth of the hold from the ceiling to the under surface of the lower deck is added to that of the height between decks, and considered as the depth. The extreme inside breadth is taken in the same way as in single-decked vessels. At Bordeaux an allowance is sometimes made for the rake of the stem and stern of the vessels.

At Boulogne, in measuring steamboats, the length of the coal and engine chambers is deducted from the length of the vessel, and her breadth is taken at the fore and aft extremities of the same, the mean of which is considered as the breadth. The depth is taken inside the pumps, from the lower surface of the deck, between the timbers. At Brest measures are frequently taken with a string, although contrary to law, and an error of seven tons in the tonnage of a cutter has been the result.

GREAT BRITAIN. See art. GREAT BRITAIN, p. 858.

SPAIN.—The breadths are measured at the following places: 1st, at the mizzen-mast; 2d, a few feet abaft the foremast; 3d, at a point half way between the two former. The heights at which the three breadths are taken at the above places are: 1st, on a level with the deck; 2d, on a level with the upper surface of the keelson; 3d, at a level half-way between the two former positions.

To find the area at each section, the half of the sum of the upper and lower measurements is added to the middle measurement, and this sum is multiplied by the height of one above the other. Then half the areas of the fore and after section is added to that of the middle section, and this sum is multiplied by the length which the sections are apart from each other. The result will express in Burgos cubic feet the capacity of the part of the hold between the fore and after sections, and it still remains to add the spaces between these and the stem and stern-post. The former may be found, without any considerable error, by multiplying the area of the foremost section by half its distance from the stem; and the latter in the same manner, by multiplying the area of the after section by half its distance from the stern-post. It is evident that the room occupied by the pumps must be deducted from the foregoing result, in order to obtain the fair quantity of space filled by the cargo.

Having thus found the capacity of the hold of any

vessel in the above manner in Burgos cubic feet, it is to be divided by $41\frac{81}{75}$, and the result will be the amount of displacement of such vessel in tons of Burgos measure, because each ton is reckoned equal to $41\frac{81}{75}$ feet of Burgos.

PORTUGAL.—For single-decked vessels, the length is measured from the cabin bulkheads to the forecabin bulkheads. The depth is measured from the upper surface of the keelson to the under surface of the beams. The extreme breadth of the deck is considered the breadth. The continued product of these three dimensions will give the contents in cubic feet, which, divided by $57\frac{126}{1000}$, gives the tonnage.

Vessels of two Decks.—In these vessels two distinct operations are made; one for the hold, the other for the middle deck. For the hold: The length is measured from the heel of the bowsprit to the stern-post. The breadth is the extreme breadth of the upper deck, deducting two feet. The depth is from the upper surface of the keelson to the under surface of the beams. For the middle deck: The length is considered as half of that for the hold, the other half being allowed for cabins, etc.—the breadth as before; and for the depth, the height of the middle deck to the under surface of the beams.

The foregoing is the method adopted at Lisbon; but at Oporto the length of the vessel is taken from the second timber at the bows to the stern-post; the breadth at the widest part from the inside of each bulwark on the upper deck; and the depth from the upper surface of the keelson, to the lower surface of the beams of the upper deck at the main hatchway.

If the keelson be more than ordinarily thick, allowance is made accordingly; and where there are two decks, the thickness of the lower deck is also deducted from the depth. The length is then multiplied by the breadth, and the product by the depth. The product is then divided by 96, the number of Portuguese cubic feet contained in a ton, and the result is the tonnage of the vessel.

NAPLES.—For vessels with two decks, the length is measured from one end of the vessel to the other, *overall*. The length is also measured from the after part of the stem to the rudder hatch, under the poop. The mean between these two lengths is multiplied by the extreme breadth of the vessel. The depth is then taken from the bottom of the well to the lower surface of the upper or poop deck; and the above product being multiplied by this depth, and divided by 94, gives the tonnage.

For single-decked vessels, the tonnage is found by multiplying the extreme length by the extreme breadth, and the product by the extreme depth, and divided by 94, as above.

NETHERLANDS.—The length is measured on deck from the stem to the stern-post. For the breadth, the hold is divided into four portions, and two measurements taken at each of the three divisions: 1st, across the keelson, on a level with the upper surface, from ceiling to ceiling; 2d, the greatest breadth of the hold at each division. The mean of these six measurements is considered the breadth. The depths are taken at each of the foregoing points of division, from the upper surface of the keelson to the lower surface of the upper deck between the beams, and the mean of these three is resumed. The length, breadth, and depth are then multiplied together, and two-thirds of the product is considered as the tonnage. Allowance for provisions and water, cabin and ship's stores, varying from $\frac{30}{100}$ to $\frac{45}{100}$, is deducted from the depth before it is multiplied by the length and breadth.

NORWAY.—From the after part of the stem, the length of the ship is taken to the inner part of the stern-post. Dividing the length of the vessel into four equal parts, the breadth is measured at each of these divisions. The depth of the vessel, from the

under surface of the upper deck to the keelson, is taken at the above three points of division. Then multiply the length by the mean of the three breadths, and this product by the mean of the three depths. The result of the foregoing is divided by $242\frac{1}{2}$, if there be no fractional parts of feet; but if there are, the calculation is made in inches, and the divisor becomes 322,776, the result thus obtained being the burden of the vessel in wood lasts, of 4000 Neva lbs. each. To reduce these into commerce lasts, one of which is equal to 5200 Neva lbs., it is multiplied by 10, and divided by 18.

RUSSIA.—Length of the keel in feet, multiplied by the extreme breadth over the sheathing, and the product multiplied again by half the breadth, and divided by 94, gives the number of English tons.

UNITED STATES.—If the vessel be double-decked, the length is taken from the fore part of the main stem to the after part of the stern-post, above the upper deck; the breadth, at the broadest part above the main wales, half of which breadth is accounted the depth. From the length three-fifths of the breadth is deducted; the remainder is multiplied by the breadth, and the product by the depth. The last product is divided by 95, and the quotient is deemed the true tonnage of such ship or vessel. See page 1855.

If the ship or vessel be single-decked, the length and breadth are taken as above for a double-decked vessel, and three-fifths of the breadth are deducted from the length. The depth of the hold is taken from the under side of the deck-plank to the ceiling in the hold. These are multiplied and divided as aforesaid, and the quotient is the tonnage. At some places a system of measuring, called carpenter's tonnage, appears to be adopted. The rule is as follows:

For vessels with one deck, multiply the length by the breadth of the main beam, and the product by the depth. Divide this second product by 95. For double-decked vessels, take half the breadth of the main beam for the depth, and work as for a single-decked vessel.

At New Orleans, the mode at present in use is to take the length from the stem to the after part of the stern-post, on the deck. Take the greatest breadth over the main hatch, and the depth from the ceiling of the hold to the lower surface of the deck at the main hatch. From the length deduct three-fifths of the breadth, multiply the remainder by the actual breadth and depth, and divide by 95 for a vessel with a single deck; but if the vessel have a double deck, half the breadth of the beam is considered as equivalent to the depth, and is multiplied accordingly.

Tonnage Duties.—By an act of Congress, May 31, 1830, it is ordered that no tonnage duties shall be paid by ships or vessels of the United States, of which the officers and two-thirds of the crew shall be citizens of the United States; and all acts imposing tonnage duties on such ship are repealed.

Under the provisions of the act of the 27th May, 1848, extending privileges to American vessels, bound from one port to another in the United States, touching at a foreign port for certain purposes, a bond for the return of the seamen and crew list, prescribed by law in cases of vessels bound on a foreign voyage, is required, and the seamen must all be accounted for.

American vessels, owned by Americans or others, without register, are subject to a tonnage duty of one dollar per ton, and 10 per cent. additional duty on the cargo, as foreign vessels.

American-built vessels, owned wholly or in part by foreigners, are subject to tonnage duty of thirty cents per ton, and 10 per cent. additional duty on cargo, unless exempt by treaty.

American vessels, on arrival from foreign ports, are subject to a tonnage duty of fifty cents per ton, unless the officers and two-thirds of the crew for the whole voyage are American citizens.

The discharge of seamen from an American vessel, although by mutual consent, certified by a consul, will

not exempt the vessel from the payment of tonnage duty incurred as above. The only exemption provided by law is in cases of sickness, death, desertion, or being made prisoners of war; which must be certified by an American consul.

All acts imposing duties on the tonnage of the ships and vessels of foreign nations, so far as they relate to the imposition of such duties, are repealed; provided that all discriminating or countervailing duties of such foreign nations, as far as they operate to the disadvantage of the United States, have been abolished.

* Year ending June 30, 1857. † 1853. ‡ 1854. § 1855.

These statistics are the latest that can be obtained, and are given to show the comparative tonnage rather than as accurate statements. Several discrepancies, as in the case of the tonnage of France, are unavoidable.—For more accurate statistics, see the countries under their proper heads. For the statistics in regard to the tonnage of the United States, see article UNITED STATES.

Tontine, a species of life annuity, with benefit of survivorship, so called from Lorenzo Tonti, a Neapolitan, with whom the scheme originated, and who introduced it into France, where the first tontine was opened in 1638. The subscribers were divided into ten classes, according to their ages, or were allowed to appoint nominees, who were so divided; and a proportionate annuity being assigned to each class, those who lived longest had the benefit of their survivorship, by the whole annuity being divided among the diminished number. The terms of this tontine may be seen in the French *Encyclopédie*, Finance Division, vol. iii. In 1689 a second tontine was opened in France. The last survivor was a widow, who at the period of her death, at the age of 96, enjoyed an income of 73,500 livres for her original subscription of 300 livres. The late celebrated Mr. Jennings was an original subscriber for a £100 share in a tontine company; and being the last survivor of the shareholders, his share produced him £3000 *per annum*. He died worth £2,115,244, aged 103 years, June 19, 1798. The last French tontine was opened in 1759. They had been found very onerous, and in 1763 the Council of State determined that this sort of financial operation should not be again adopted. Tontines have seldom been resorted to in England as a measure of finance. The last for which the government opened subscriptions was in 1789. The

terms may be seen in Hamilton's *Hist. Public Revenue*, p. 210. There have been numerous private tontines in England and in the United States. The Tontine Building, Wall Street, New York, was erected during the years 1792-1794, upon this principle, by an association of merchants. By the constitution under which the association was formed, 208 shares were subscribed, at \$200 a share, severally depending upon a life selected by each subscriber. The old building was razed to the ground in 1855, and was superseded in the same year by a substantial edifice.

Top, a sort of platform surrounding the lower mast-head, from which it projects on all sides like a scaffold. The principal intention of the top is to extend the angle with the mast, and thereby give additional support to the latter. The top is also very convenient to contain the materials necessary for extending the small sails, and for fixing and repairing the rigging and machinery with greater expedition. In ships of war the tops are furnished with swivels, musketry, and other fire-arms, and are guarded with a fence of hammocks in time of action. Finally, the top is employed as a place for looking out, either in the day or night.—E. A.

Topaz (*Ger. Topas*; *Fr. Topase*; *It. Topazio*; *Sp. Topacio*; *Russ. Topas*). The name topaz has been restricted by M. Haüy to the stones called by mineralogists Occidental ruby, topaz, and sapphire; which, agreeing in their crystallization and most of their properties, were arranged under one species by M. Romé de Lisle. The word topaz, derived from an island in the Red Sea, where the ancients used to find topazes, was applied by them to a mineral very different from ours. One variety of our topaz they denominated chrysolite. Color, wine yellow. From pale wine yellow it passes into yellowish white, greenish white, mountain green, sky blue; from deep wine yellow into flesh red and crimson red. Specific gravity from 3.464 to 3.641.—Thomson's *Chemistry*.

Yellow Topaz.—In speaking of the topaz, a gem of a beautiful yellow color is always understood: it is wine yellow, of different degrees of intensity; and the fuller and deeper the tinge, the more the stone is esteemed. In hardness it yields to the spinelle. There are few gems more universal favorites than the yellow topaz, when perfect; the rich warm tone of its color, the vivacity of its lustre (which it retains even by the side of the diamond), and its large size, compared with many others, are characters which deservedly entitle it to distinction; it bears, accordingly, a high price when of good quality. It is chiefly employed for necklaces, ear-drops, bracelets, etc., in suit. No little skill and taste are required in cutting and duly proportioning this gem; the table should be perfectly symmetrical, and not too large; the bise of sufficient depth, and the collet side should be formed in delicate steps. It works easily on the mill, and the lapidaries are in general tolerably well acquainted with it; yet it is uncommon to meet with one well cut. The yellow topaz varies in price according to its beauty and perfection. A superlatively fine stone, perfect in color and workmanship, sufficiently large for an armlet, or any other ornament, and weighing nearly 80 carats, was sold for £100. Topazes have become more common since our intercourse with Brazil; consequently, they are less in demand, and lower in price. A fine stone of 60 carats may be purchased at from £20 to £35; and smaller, calculated for ring stones, at from £2 to £5, but it is not usual to sell them by weight.

Pink Topaz.—This is made from the yellow, which, when of intense color, is put into the bowl of a tobacco pipe or small crucible, covered with ashes or sand: on the application of a low degree of heat, it changes its color from a yellow to a beautiful pink. This is performed with little hazard; and, if the color produced happens to be fine, the price is much augmented.

Red Topaz.—This beautiful gem, which very seldom occurs naturally, is of a fine crimson color, tinged

with a rich brown; it is extremely rare, and generally taken to be a variety of ruby, for which I have seen it offered for sale. Its price, from its scarcity, is quite capricious; it has an exquisite pleasing color, very different from the glare of the artificial pink topaz.

Blue Topaz is also a beautiful gem, of a fine celestial blue color. It has occurred of considerable magnitude; the finest specimen known I brought in the rough from Brazil; when cut and polished, it weighed about $1\frac{1}{2}$ oz. Smaller specimens are not uncommon, and when light-colored are often taken for aqua-marinas, from which they may always be distinguished by their greater weight and hardness, etc.

White Topaz is familiarly called *Minas Nova*. It is a beautiful pellucid gem, and is used for bracelets, necklaces, etc. It possesses greater brilliancy than crystal; and, from its hardness, has been used to cover paste, etc., and to form doublets."—MAWE on *Diamonds*.

Top-mast, the second division of a mast, or that part next above the lower mast. *Top-gallant mast*, the mast next above the top-mast, and is generally the uppermost mast. *Top-sails*, large sails extending across the top-mast. *Top-gallant sails* are extended above the top-sail yards, in the same manner as the top-sails are extended above the lower yards.

Tornado (Spanish), a violent hurricane or gust of wind, which, arising suddenly from the shore, veers round to all points of the compass, and indeed has been described as blowing from all points at once. Tornadoes are usually accompanied with thunder-storms, and are generally of short duration. They are frequent in the Chinese seas and the West Indies.

Toronto, city, at one time the capital of Canada, is situated on Toronto Bay, in the township and county of York, lat. $43^{\circ} 32' N.$, long. $79^{\circ} 20' W.$ It is 45 miles northeast from Hamilton, 165 miles west from Kingston, 363 miles from Montreal, 543 miles from Quebec, and 1353 from Halifax, Nova Scotia.

The bay is a beautiful sheet of water, separated from the main body of Lake Ontario, except at its entrance, by a long narrow strip of sandy beach, the southwest termination of which is known as "Gibraltar Point." The city was founded in 1794 by Governor Simcoe, and is laid out in the form of a parallelogram, being above three miles long by one and a half wide; the streets, which are straight and wide, intersecting at right angles. The esplanade fronting the bay extends for a distance of two miles. In 1817 the population amounted to 1200; in 1830 to 2860; in 1842 to 15,336; in 1850 to 25,166; in 1852 to 30,763; and in 1854 to over 40,000. The city is lighted with gas, and is well supplied with water, by companies incorporated for those purposes.—See TRADE. From Toronto the capital was removed to Quebec, and in 1857-'58 was finally established at Ottawa, formerly Bytown.

Tortoise-shell (Fr. *Ecaille de Tortue*; It. *Scaglia de Tartaruga*; Ger. *Schildpad*; Malay, *Sisik kwayakura*), the brown and yellow scales of the *Testudo imbricata*, or tortoise, a native of the tropical seas. It is extensively used in the manufacture of combs, snuff-boxes, etc., and in inlaying and other ornamental work. The best tortoise-shell is that of the Indian Archipelago; and the finest of this quarter is obtained on the shores of the Spice Islands and New Guinea. When the finest West Indian tortoise-shell is worth, in the London market, 46s., the finest East Indian is worth 60s. per lb. Under the latter name, however, a great deal of inferior shell is imported, brought from various parts of the East Indies. The goodness of tortoise-shell depends mainly on the thickness and size of the scales, and in a smaller degree on the clearness and brilliancy of the colors. Before the opening of the British intercourse with India, the greater part of the tortoise-shell which eventually found its way to Europe was first carried to Canton, which then formed the principal mart for the commodity. It is still an

article of trade from that city; but the imports and exports are inconsiderable, Singapore being now the chief mart for this article. Its price at the latter varies from 750 and 900 to from 1000 to 1600 dollars per picul, according to quality.—CRAWFORD'S *Indian Archipelago*; *Singapore Chronicle*; *Canton Register*.

Toulon (*Telo Martius*), a commercial and important military and naval port of France, department of Var, on a fine bay of the Mediterranean, 40 miles southwest from Draguignan. Lat. (of observatory) $43^{\circ} 7' 5'' N.$, long. $5^{\circ} 56' E.$ Population, 40,000. Mean temperature of year, $62^{\circ} 2$; winter, $48^{\circ} 5$; summer, $75^{\circ} 2$ Fahrenheit. It is strongly fortified, defended by a double line of bastioned fortifications, and strengthened by forts on the adjacent heights. The French consider it impregnable. It has a tribunal and chamber of commerce, tribunal of marine, school of navigation, commercial college, and public library. The streets are watered by numerous fountains. Around the harbor are immense magazines and arsenals, ship-building docks, rope and sail-works, and the *bagne* or convict prison, usually occupied by 4000 to 5000 culprits. Toulon was originally a Roman colony; it was taken by the constable of Bourbon in 1524, and by Charles V. in 1536. It was given up to the English in August, 1798; in December of the same year it was taken by the French republicans, after a memorable siege, during which Napoleon commenced his military career. *Toulon-sur-Arroux* is a commune and village, department of Saône-et-Loire, eighteen miles north-northwest from Charolles. Population about 1700.

Toys (Ger. *Spielezeug*, *Spellsachen*; Du. *Speelgoed*; Fr. *Jouets*, *Bimbelots*; It. *Trastulli*; Sp. *Dijes*, *Juquetes de niños*; Russ. *Igrushki*) include every trifling article made expressly for the amusement of children. How frivolous soever these articles may appear in the estimation of superficial observers, their manufacture employs thousands of hands, and gives bread to many families.

Children's toys are brought in immense numbers from the hilly regions of Germany, Austria, and Switzerland. The forests supply abundance of timber at very low cost; and the peasant mountaineers, simple and frugal, employ their leisure hours and the time of their children in fabricating these articles. Dealers are sure to be found who will drive a trade in these trifles in some country or other. The *Art Union Journal*, a few years ago, gave some curious information concerning the better kind of carved German toys: "The best German toys come from the town of Sonneberg, on the southeastern frontier of the forest of Thuringia. It has a population of 4000 inhabitants, of which the greater part are employed in the trade. The principal toy-merchants, numbering about thirty, provide themselves with goods from many hundred different makers of common articles, resident in the town and its vicinity; these, again, are furnished by the neighboring villagers with the requisite roughly-prepared articles in wood, which are fitted up, carved, and painted by the makers in the town. Every year about 25,000 cwt. of these goods are exported to almost every part of the world, but the manufacturers are confined to the use of wood or pasteboard, or these two materials combined. The factory from which the best toys are derived is that of Adolph Fleischmann, who employs none but first-rate workmen; and it is interesting to notice the many admirable productions these uneducated artists produce—models and groupings of figures that would cast no discredit on the atelier of a Bailey or a Westmacott."

Trade, Board of. See BOARD OF TRADE, p. 312.

Trade-winds (so called from their favoring commerce), easterly winds which constantly prevail, with slight variations, within the tropics. It is a common notion that the northeast trade-wind blows exactly from the northeast point nearly to the equator, when it gradually becomes more and more easterly, till at

length it blows due east; and so with the southeast trade. This notion is, however, erroneous. The trade-winds in the Atlantic and Pacific oceans extend to about 28° of latitude each side of the equator, so that a ship, after passing 30° , may expect to enter them every day. But, on first entering them, they will be found to blow from the east, or even a little southerly, and, as you advance, to draw round gradually to north-east, and even north, at the southern limit of the north-east trade, where it is commonly represented as being due east. This limit varies with the position of the sun, reaching, when the sun has a southern declination, to within three or four degrees north latitude; and, as the sun acquires a more northern declination, receding ten or twelve degrees from the equator. At this point the mariner enters the region of *calms* and *variables*, as they are called, where the wind has more or less southerly direction, and sometimes blows freshly from the south-southwest. This region varies from 150 to 550 miles, and is subject to heavy rains. On passing this range the southeast trade begins, and is subject to the same phenomena as the northeast. To the north and south of the northeast and the southeast trades westerly winds will be found generally to prevail, though less regular in the northern than in the southern hemisphere; and it has been remarked that the average of the passages made by the Liverpool packets from New York out, for a period of six years, was twenty-three days, and from Liverpool to New York, that is, from east to west, thirty-eight days.—E. A. See WINDS.

Trade-winds is a name given to certain remarkable aerial currents, on account of their signal aid to navigation. In those parts of the Atlantic and Pacific oceans which are remote from the influence of the land, between the limits of about 28° or 30° north and south latitude, there is a constant easterly wind. On the north side of the equator it blows from between the north and east, and on the south side from the south and east, according to the distance from the equator; these winds are called the northeast and southeast trade-winds, and are the cold currents of air flowing from the poles to the equator, altered in direction by the rotation of the earth upon its axis. The direction and extent of the trade-winds vary with the seasons of the year, and in different parts of the world their course is entirely altered, the most remarkable modification shown being the monsoons.—See MONSOONS; also, articles ATLANTIC OCEAN, GULF STREAM, CURRENTS, WINDS.

Tragacanth, a species of gum, the produce of the *Astragalus tragacantha*, a thorny shrub growing in Persia, Crete, and the islands of the Levant. It extends about the end of June from the stem and larger branches, and soon dries in the sun. It is inodorous, impressing a very slightly bitter taste as it softens in the mouth. It has a whitish color; is semi-transparent, and in very thin, wrinkled, vermiform pieces; it is brittle, but not easily pulverized, except in frosty weather, or in a warmed mortar. It should be chosen in long twisted pieces, white, very clear, and free from all other colors; the brown, and particularly the black pieces, should be wholly rejected.—THOMSON'S *Chemistry*; THOMSON'S *Dispensatory*; MILBURN'S *Oriental Commerce*.

Treasury Notes. A species of Treasury Notes, termed Continental currency, was issued by order of the Continental Congress. This depreciated rapidly, and no provision was made afterward for its redemption by Congress. The amount issued was estimated at \$400,000,000; Mr. Jefferson calculated that the real value given for these notes was only \$72,000,000. The assignats of the French Republic during the revolution were authorized by the National Assembly, in April, 1790. At one period they amounted to the enormous sum of eight milliards of francs (8,000,000,000), or equivalent to nearly £350,000,000 sterling.—ALTON'S *History of Europe*. In May, 1812, Mr. Albert Gallatin, Secretary of the Treasury, recommended the

issue of Treasury Notes to the extent of \$4,900,000, repayable one year after date, and receivable in the mean time for government dues, and bearing 5 2-5 per cent. interest. These were authorized by act of Congress, June 30, 1812. Treasury Notes were also suggested by Mr. A. J. Dallas, Secretary of the Treasury, in January, 1815. He reported that the Treasury would require for the fiscal year \$40,906,124 in addition to the ordinary revenue (see *Funding System, U. S.*, p. 607), of which \$15,000,000 was to be in Treasury Notes at 5 2-5 per cent. per annum (or about $1\frac{1}{2}$ cent per day for every hundred dollars).

Up to December 4, 1819, the amount issued was \$36,680,794, viz.:

By act of 20th June, 1812	\$5,000,000
" 25th February, 1813	5,000,000
" 4th March, 1814	10,000,000
" 26th December, 1814	8,318,400
" 24th February, 1815	8,362,394

Total.....\$36,680,794

Of this amount all were redeemed prior to October 1, 1824, except \$19,756. Further issues of Treasury Notes was made under acts of 12th October, 1837; 21st May, 1838; and 2d March, 1839. From the year 1812 to 31st December, 1843, the total issue of Treasury Notes was \$84,611,833, and amount received from loans \$98,360,112, viz.:

Years.	Loans.	Treasury Notes.	Total.
1812	\$10,032,400	\$2,835,500	\$12,867,900
1813	20,039,635	6,094,800	26,134,435
1814	15,080,546	8,297,865	23,378,411
1815	14,857,423	20,406,897	35,264,320
1816	1,357,586	8,136,549	9,494,135
1817	734,542	734,542
1818	8,765	8,765
1819	2,291	2,291
1820	3,040,000	824	3,040,824
1821	5,000,000	324	5,000,324
1837	2,992,989	2,992,989
1838	12,716,820	12,716,820
1839	3,857,276	3,857,276
1840	5,539,547	5,539,547
1841	5,665,756	7,993,500	13,659,256
1842	11,383,405	3,425,329	14,808,735
1843	11,853,353	1,518,150	13,401,508
Total.....	\$98,360,112	\$84,611,833	\$182,971,945

Of the issues between 1837 and 1843, there were outstanding September 30, 1847, \$239,789. Further emissions were authorized by act of Congress, under date of 23d July, 1846, and 28th January, 1847; \$10,000,000 by the act of 1846, not exceeding 6 per cent. interest; and \$23,000,000 by the act of 1847; and a further issue by act of December, 1857.

In March, 1858, the bills for the new issue of Treasury Notes were opened at the Treasury Department. The result was, that \$2,600,000 were taken at rates varying at $\frac{3}{4}$, $\frac{3}{8}$, $\frac{1}{2}$, $\frac{3}{4}$, $\frac{1}{2}$, and $\frac{1}{4}$. The remainder of the 5,000,000 was taken in 5 per cents. Some of the bids were for permanent investment, while others were for speculation.

There is a species of Treasury Notes in common use in England, known as Exchequer Bills. These were first created in the year 1696, two years after the incorporation of the Bank of England. They have been issued annually ever since. These bills bear an interest of 1d., $1\frac{1}{2}$, 2 or $2\frac{1}{2}$ pence per day on each £100, equivalent to $1\frac{1}{2}$ @ 3 per cent. per annum. Of these bills there were issued in 1852, £17,742,800, at $1\frac{1}{2}$ d.; 1853, £17,742,500, at 1d. @ $2\frac{1}{2}$ d.; 1854, £16,029,600, at $2\frac{1}{2}$ d.; 1855, £17,183,000. These are a favorite investment for short periods.—See EXCHEQUER.

In 1768 the Empress Catharine the Second, of Russia, established the Banque d'Assignat, to issue government notes payable to bearer. The amount at first issued was 40,000,000 of roubles. In 1786 the amount was extended to 100,000,000, and they soon after rapidly depreciated.

Treaties, Commercial. By a commercial treaty is meant a treaty between two independent nations, for facilitating, and most commonly also regulating, the commerce carried on between them. During the

Middle Ages, and down, indeed, to a comparatively recent period, foreigners resident in a country, whether for commercial or other purposes, were for the most part subject to very harsh treatment. At one time it was usual in England to make aliens liable for the debts and crimes of each other; and the practice, formerly, so common, of laying heavier duties on the goods imported and exported by aliens than by British subjects, is not even yet, we grieve to say, altogether abandoned. In France and some other countries, during the 14th and 15th centuries, a stranger was incapable of bequeathing property by will; and the whole of his personal as well as real estate, fell, at his death, to the king or the lord of the barony. This barbarous law was known by the name of *Droit d'Aubaine*, and was not completely abolished in France till a very late period.—ROBERTSON'S *Charles V.*, vol. I. Previously to last century, the laws with respect to shipwreck, though infinitely more humane than they had been at a more remote period, were calculated rather to promote the interest of the sovereign of the country, or the feudal lords on whose territories shipwrecked vessels might be thrown, than those of the unfortunate owners or survivors. The most serious obstacles were then also opposed by the prevalent insecurity, and the arbitrary nature of the tolls which the lords were in the habit of exacting, for the transit of commodities through the territories of one state to those of another. The practice of confiscating shipwrecked property continued in France till 1681, when it was abolished by an edict of Louis XIV. It was at one time common in Germany, to use the words of M. Bouchaud, "*pour les prédicateurs de prier Dieu en chaire, qu'il se fasse bien des naufrages sur leurs côtes!*"—*Théorie des Traités de Commerce*, p. 118. And the fact that the celebrated jurist Thomasius wrote a dissertation in defense of such prayers, affords, if possible, a still more striking proof of the spirit of the period.

Under such circumstances, it became of much importance for commercial states to endeavor to obtain, by means of treaties, that protection and security for the persons and properties of their subjects, when abroad, against unjust treatment and vexatious exactions, which they could not have obtained from the laws of the countries in which they might happen to reside. Thus it was stipulated by Edward II., in 1325, that the merchants and mariners of Venice should have power to come to England for ten years, with liberty to sell their merchandise and to return home in safety, "*without having either their persons or goods stopped on account of other people's crimes or debts.*"—ANDERSON, *anno* 1325. The commercial treaties negotiated during the 15th, 16th, and 17th centuries, are full of similar conditions; and there can be no doubt that by providing for the security of merchants and seamen when abroad, and suspending, with respect to them, the barbarous laws and practices then in force, they contributed materially to accelerate the progress of commerce and civilization. Commercial treaties were also negotiated at a very early period for the regulation of neutral commerce during war, and for defining the articles that should be deemed contraband, or which it should not be lawful for neutral ships to convey or carry to either belligerent. These are obviously points that can only be decided by express stipulations.

Instead, however, of confining commercial treaties to their legitimate and proper purposes—the security of merchants and navigators, and the facility of commercial transactions—they very soon began to be employed as engines for promoting the commerce of one country at the expense of another. For more than two centuries, those engaged in framing commercial treaties have principally applied themselves to secure, either by force or address, some exclusive advantage in favor of the ships and products of their particular countries. Hence these compacts are full of regulations as to the duties to be charged on certain articles,

and the privileges to be enjoyed by certain ships, according as they were either produced by or belonged to particular countries. It was in the adjustment of these duties and regulations that the skill of the negotiator was chiefly put to the test. It was expected that he should be thoroughly acquainted with the state of every branch of industry, both in his own country and in the country with which he was negotiating; and he was to endeavor so to adjust the tariff duties, that those branches in which his own country was deficient might be benefited, and those in which the other was superior might be depressed. The idea of conducting a negotiation of this sort on a fair principle of reciprocity is of very late origin; success in circumventing, in overreaching, or in extorting, from fear or ignorance, some oppressive, but at the same time worthless privilege, was long esteemed the only proof of superior talent in negotiators.

In an able tract, attributed to Mr. Eden, afterward Lord Auckland, published in 1787 (*Historical and Political Remarks on the Tariff of the French Treaty*), there is the following outline of the qualifications necessary to the negotiator of a commercial treaty: "Besides a general knowledge of the trade and reciprocal interests of the contracting parties, he ought to be precisely acquainted with their several kinds of industry and skill; to discover their wants, to calculate their resources, and to weigh with nicety the state of their finances, and the proportionate interest of their money; nay, further, he should be able to ascertain the comparative population and strength of each country, together with the price and quality both of first materials, and also of the labor bestowed upon them: for this purpose he should inquire into the operations of every class of merchants and manufacturers concerned in the trade; should consult their expectations on each of its several branches; and collect their hopes and fears on the effect of such a commercial revolution, on the competition of rival nations. A good treaty of commerce, independent of the art of negotiation, is pronounced, by one who well knew the extent and difficulty of the subject, to be a '*master-piece of skill.*'"

It is visionary to imagine that any nation will ever continue to grant to another any exclusive advantage in her markets, unless she obtain what she reckons an equivalent advantage in the markets of the other. And if a commercial treaty stipulating for an exclusive privilege be really and *bonâ fide* observed by the country granting the privilege, we may be sure that the concessions made by the country in whose favor it is granted are sufficient fully to countervail it. Those who grasp at exclusive privileges in matters of this sort, or who attempt to extort valuable concessions from the weakness or ignorance of their neighbors, are uniformly defeated in their object. All really beneficial commercial transactions are bottomed on a fair principle of reciprocity; and that nation will always flourish most, and have the foundations of her prosperity best secured, who is a universal merchant, and deals with all the world on the same fair and liberal principles.

As early as 1783, Mr. Pitt, then Chancellor of the Exchequer, proposed a bill in the British Parliament, based upon the liberal principle of "admitting to all the ports of the British dominion American vessels loaded with goods the growth or produce of the United States, on the same terms as British vessels or goods;" but the proposition at once startled the fears of the British merchants, who, with the aid of Lord North, Mr. Fox, and Lord Sheffield, succeeded in transferring the whole subject to the discretion of the king and his council. The consequence was, that an order was immediately issued, not only excluding American vessels from all participation in the colonial trade, but prohibiting the exportation from the United States of provisions and fish, even in British bottoms.

English Treaties.—The first formal and written treaty made by England with any foreign nation was entered into A.D. 1217. The first commercial treaty was with the Flemings, 1 Edward, 1272; the second with Portugal

and Spain, 1308.—ANDERSON. The chief treaties of the principal civilized nations of Europe will be found described in their respective places. The following forms an index to them:

Treaties of Commerce and Navigation between the United States and foreign Nations.—The United States has treaties, conventions, or reciprocal regulations of commerce and navigation with thirty-eight foreign nations, all of which are in force, either in pursuance of the stipulations and terms expressed therein respectively, or by virtue of decrees, royal orders, or other local regulations on the part of foreign governments, on the one side, and of proclamations by the President of the United States on the other. The difficulty of referring to any particular treaty, or of ascertaining at a glance the precise character of the commercial regulations of any particular country, is ob-

vious. With a view, chiefly, to remedy this inconvenience, the following summary of these treaties has been prepared; and it will enable all interested in the foreign trade of the United States readily to ascertain the footing on which our commerce and navigation are placed in foreign countries with which treaties exist, and the treatment to which the commerce and navigation of such foreign countries, respectively, are entitled in the ports of the United States.

The following are the foreign countries, arranged in alphabetical order, between which and the United States commercial treaties are now in force, with the dates of such treaties, respectively:

Argentine Confederation.....	July 10 and 27, 1853.	Morocco.....	September 16, 1836.
Austria.....	August 27, 1819.	Muscot.....	September 21, 1833.
Belgium.....	November 10, 1845.	New Granada.....	December 12, 1846.
Bolivia.....	November 30, 1836.	Oldenburg.....	March 26, 1847.
Borneo.....	June 23, 1850.	Peru.....	July 26, 1851.
Chili.....	May 16, 1832.	Portugal.....	April 23, 1841.
China.....	July 3, 1844.	Prussia.....	May 6, 1828.
Costa Rica.....	July 10, 1851.	Russia.....	October 2, 1859.
Denmark.....	April 26, 1826.	San Salvador.....	July 2, 1859.
Ecuador.....	June 13, 1839.	Sandwich Islands.....	December 20, 1849.
France.....	June 24, 1822.	Sardinia.....	November 26, 1838.
Great Britain.....	July 3, 1815.	Siam.....	April 14, 1836.
Guatemala.....	March 3, 1849.	Sweden and Norway.....	July 4, 1827.
Hanover.....	June 10, 1845.	Switzerland.....	November 9, 1855.
Holland.....	August 26, 1852.	Tripoli.....	June 4, 1806.
Hanse Towns.....	December 20, 1827.	Tunis.....	February 24, 1824.
Japan.....	March 31, 1854.	Turkey.....	May 7, 1830.
Mechlenburg Schwerin.....	December 9, 1847.	Two Sicilies.....	December 1, 1845.
Mexico.....	April 5, 1831, and February 2, 1843.	Venezuela.....	January 20, 1836.

By virtue of notice from the United States, the treaty with Denmark "ceased and determined," in accordance with the 11th article of the same, April 14, 1856.

On the 24th of May, 1828, an act was passed by the Congress of the United States, respecting commerce and navigation with foreign nations, in the following words: "*Be it enacted, etc.,* That, upon satisfactory evidence being given to the President of the United States, by the government of any foreign nation, that no discriminating duties of tonnage or impost are imposed or levied in the ports of the said nation upon vessels wholly belonging to citizens of the United States, or upon the produce, manufactures, or merchandise imported in the same from the United States, or from any foreign country, the President is hereby authorized to issue his proclamation, declaring that the foreign discriminating duties of tonnage and impost within the United States are, and shall be, suspended and discontinued, so far as respects the vessels of the said foreign nation, and the produce, manufactures, or merchandise imported into the United States in the same, from the said foreign nation, or from any other foreign country; the said suspension to take effect from the time of such notification being given to the President of the United States, and to continue so long as the reciprocal exemption of vessels belonging to citizens of the United States, and their cargoes, as aforesaid, shall be continued, and no longer."

By virtue of proclamations issued by the President of the United States, in accordance with the provisions of the law above recited, vessels belonging to Tuscany, Brazil, and Chili, are admitted into the ports of the United States on the same terms as American vessels, with the produce or manufactures of their own, or any other country; similar reciprocity being granted in those countries, respectively, to vessels and cargoes of the United States. The dates of the proclamations of the President respecting these countries are as follows: Tuscany, September 1, 1836; Brazil, November 4, 1847; Chili, November 1, 1850.

By the President's proclamation of June 7, 1827, vessels of the Pontifical states are admitted into the ports of the United States on the same terms as American vessels only when laden with the produce and manufactures of said Pontifical states; and by similar proclamation of April 20, 1847, French vessels in ballast, or laden with the produce of St. Pierre and Miquelon, and coming directly from those islands, are treated in ports of the United States as national vessels. Like favors and privileges are, of course, conceded to vessels of the United States in the Pontifical states, and at the islands of St. Pierre and Miquelon, respectively.

Summary of Treaties with the United States.—*Argentine Confederation.*—Treaties of July 10 and 27, 1853, both proclaimed April 9, 1855. The former relates to the navigation of the rivers Parana and Uruguay, and the latter establishes and regulates friendship, commerce, and navigation between the Argentine Confederation and the United States. Duration of both undefined. United States vessels enter all the places and ports on the rivers Parana and Uruguay which belong to the Argentine Confederacy, and which are open to commerce, on the payment of the same custom-house duties, harbor, light, police, and pilotage dues that are paid by the vessels of the most favored nation. This restriction to equality with the vessels of the most favored nation is qualified and enlarged by the treaty of July 27, 1853, which equalizes the vessels of the United States in all the places, ports, rivers, and territories of the confederation, with the national flag, as to tonnage, light or harbor dues, pilotage, salvage in case of shipwreck, or any other local charges whatever. Merchandise introduced into any part of the territories, ports, or places of the Argentine Confederation, in vessels of the United States, is treated, in respect of duties and all other charges, as if imported in national ves-

sels; and if such merchandise be of the growth, produce, or manufacture of the United States, it is subject to no other or higher duties than similar merchandise, the growth, produce, or manufacture of any other country. In regard to exports, United States vessels enjoy equality, as to drawbacks and bounties, with the national flag. The province of Buenos Ayres having seceded from the other provinces of the Confederation, decrees have been issued by the federal power which affect, in some respects, the commercial regulations of the republic. The latest decree of this kind is one imposing heavy differential duties on foreign merchandise introduced into the other, or fluvial provinces, through the port of Buenos Ayres. This decree, should it be carried into effect, will divert from this port, heretofore the general depôt for the trade of the other provinces, such foreign merchandise as is destined for the different points on the Parana and the Uruguay rivers.

Austria.—Treaty of August 27, 1829, to continue in force ten years from February 10, 1831, with the twelve months' notice stipulation. United States vessels are treated as national vessels, coming from the same places, in Austrian ports, whether in the direct or indirect trade. The same duties are charged on importations into Austrian ports, whether of merchandise the growth, produce, or manufacture of the United States, or of any other country; and these duties are no higher than on similar merchandise from any other country. Any favors hereafter granted by either party to the commerce or navigation of another country to become common to the other party on like conditions. The treaty establishes perfect equality between the flags of the two parties in the ports of each.

Belgium.—Treaty of November 10, 1845, to continue in force ten years from the 30th March, 1846; each party reserving the right to renounce the treaty after the expiration of that period, on giving to the other twelve months' notice of its intention to do so. United States vessels pay the same duties of tonnage, pilotage, anchorage, buoys, light-houses, clearance, brokerage, and all other charges, as Belgian vessels. This equality applies, no matter whence the vessel comes. The Belgian government guarantees restitution for any duties levied by Holland on United States vessels navigating the Scheldt. Steam-vessels of the United States engaged in regular navigation between the United States and Belgium are exempt from the payment of duties of tonnage, anchorage, buoys, and light-houses. Vessels of both parties enjoy, as to coasting trade, equal privilege with the most favored nation. The treaty restricts the equality of flags, as to duties, to the direct trade, but contains a clause providing that, "it is well understood, 1st. That the goods shall have been really put on board in the ports from which they are declared to have come; 2d. That putting in at an intermediate port by uncontrollable circumstances, duly proved, does not occasion the forfeiture of the advantage allowed to direct importation." In the indirect trade, the flag of the United States is placed on an equality with the flag of the most favored nation—except the nation of production—as to import duties. The importations of salt, and of the produce of the national fisheries, are excepted from this equality. A law of the Belgian government, of June 8, 1853, provides that "the government is empowered to allow vessels proceeding from trans-Atlantic countries, or from a port beyond the Straits of Gibraltar, to touch at an intermediate port, whether for the purpose of receiving orders or carrying on commercial transactions, by discharging or receiving cargoes." This law, while it remains in force, suspends the practical operation of that article of the treaty restricting the equality of flags to the direct trade; under its operation, the flag of the United States is equalized with the Belgian flag, whether the vessel proceeds from a port in the United States or not.—See *Report from Department of State*, Ex. Doc. No. 2, 34th Congress, 1st session, p. 135.

Bolivia.—Treaty, or general convention of peace, friendship, commerce, and navigation, of November 13, 1856. Ratifications exchanged May 28, 1858, and proclamation of the President of the United States issued October 3 of the same year. To continue in force twelve years from date of ratification, and further, for one year after either party gives the other notice of its intention to renounce it. The vessels of the United States visiting the "coasts or countries of Bolivia" (the port of Cobija) are placed, as to all charges and privileges, on a footing of equality with the vessels of the most favored nation. Should United States vessels, either of war (public or private), of trade, or employed in the fisheries, whether through stress of weather, want of water or provisions, pursuit of pirates or enemies, be forced into the rivers, bays, or ports of Bolivia, they shall be received and treated with humanity, and all favor and protection shall be given to them suitable to their respective exigencies. Merchandise and articles of commerce of every kind and description, the importation of which is not prohibited to all other nations, imported in vessels of the United States into Bolivia, are subject to the same duties as similar merchandise and articles imported in the vessels of the most favored nation. The merchants and citizens of the United States are allowed to manage for themselves all their commercial transactions, whether of consignment and sale of their goods, or with respect to the purchase of their return cargoes, or loading and sending off their vessels. This convention is styled the "Peru-Bolivian," and was negotiated when these two republics were confederated under one government. Peru having at a subsequent period re-established its independence of Bolivia, disavowed the convention, and a new treaty was entered into with that republic. It is still in force, however, as regards Bolivia. By a decree of January 27, 1853, the Bolivian government declared free to the commerce and mercantile navigation of all the nations of the globe the waters of the navigable rivers, which, flowing through the territories of Bolivia, empty into the Amazon and Paraguay; and, by virtue of a treaty of June 14, 1856, between Brazil and Paraguay, the navigation of the Upper Paraguay river was made free, and Bolivia opened to an Atlantic market.

Borneo.—Convention of June 23, 1850, ratified July 11, 1853,—establishes perpetual peace, friendship, and good understanding between the citizens and subjects of the two contracting parties. No higher duty than one dollar per registered ton to be levied on American vessels entering the ports of the Sultan of Borneo; and this fixed duty to be in lieu of all other charges or duties whatever. Importations in United States vessels subject only to the same duties as apply to similar importations in vessels of the most favored nation; and no prohibitions exist, either as respects importations or exportations; the latter of which, if the produce or manufacture of the sultan's dominions, to be always exempt from duty. Citizens of the United States are permitted to enter, pass through, and trade in, all parts of the sultan's dominions, and to enjoy all the privileges granted to the citizens of the most favored nations. They may also purchase, rent, occupy, and acquire, in a legal manner, all kinds of property within the dominions of the sultan.

China.—Treaty concluded July 3, 1844, and proclamation made by the President of the United States April 18, 1846. Not limited as to duration; the United States, however, reserving the right, after the expiration of twelve years from the date of the convention, to open negotiations, should it be deemed necessary to do so, for such modifications in the articles relating to commerce and navigation as may be requisite. Vessels of the United States may enter any of the five ports open to foreign commerce, viz.: Canton, Amoy, Foo-chow-Fu, Ningpo, and Shanghai, but no other ports, under penalty of confiscation of vessel and cargo. When American vessels shall have entered port, offi-

cers may be sent on board as a guard, at the expense of the custom-house; and within forty-eight hours after a vessel shall have cast anchor, the proper officer must deposit the ship's papers in the hands of the American consul, who will forthwith communicate to the superintendent of customs the name and tonnage of such vessel, the names of her men, and the character of the cargo; after which the superintendent will give a permit for discharging; or, if the master so desire, he may, within twenty-four hours depart, without breaking bulk, for another port; in which case he will not be liable to pay tonnage or other duties until he proceeds to discharge at such other port. Tonnage duties to be, on vessels of over 150 tons, 5 mace (74 cents) per ton; 150 tons or under, 1 mace (14½ cents), paid only at one port. United States vessels may import and export all kinds of merchandise not prohibited in the tariff. No new restrictions or monopolies to be created. Duties to be paid in Sycee silver or in foreign money. Discharging cargo without a permit subjects the captain to a fine of \$500, and the confiscation of the goods so landed; but if part of cargo only is landed, duties to be paid on such part only. Goods are not to be transhipped from on board one vessel to another, unless there be some particular occasion for doing so, which occasion shall be certified by the consul to the superintendent of customs. Imported goods, having paid duties on their resale or transit in any part of the empire, are subject to the imposition of no other duty than they were accustomed to pay at the date of the treaty. It is also provided that vessels forced in any way to take refuge in any port other than one of the free ports, shall receive friendly treatment, and the means of safety and security. The importation of opium is prohibited, but a large contraband trade is regularly carried on in this article through the connivance of Chinese officials. Saltpetre and spelter are government monopolies, and can be sold only to the government merchants. Rice and other grains are free of duty. Should a difference arise as to the value of clocks, watches, jewelry, or of other merchandise on which there is an ad valorem duty, and the parties can not agree, the question may within twenty-four hours, but not afterward, be referred to the consul of the party interested, to be adjusted by him and the superintendent of customs.

Chili.—Convention of amity, peace, commerce, and navigation of May 16, 1832; ratifications exchanged, and proclamation made April 29, 1834. To continue in force twelve years from date of exchange of ratifications, with the usual stipulation providing for twelve months' notice after that period. Vessels of the United States are placed on an equal footing in respect of charges and privileges with those of the most favored nation. Vessels driven into Chilian ports by stress of weather or other compulsory causes, to be protected, and favored in every respect, until they are placed in a condition to continue their voyage. Imports, the produce or manufacture of any country, not prohibited to be imported, subject to the same duties, charges, and fees under the United States flag as when imported in vessels of the most favored nation. Citizens and merchants of the United States are allowed to manage for themselves their own commercial operations. All favors granted to the citizens or flag of any other nation to become common, on similar conditions, to the citizens and vessels of the United States; exceptions being reserved by Chili in favor of Bolivia, the Central American states, Mexico, Peru, and the Argentine Confederation. The government of the republic of Chili notified that of the United States, under date of October 31, 1850, that no other or higher duties of tonnage or impost would be imposed on vessels of the United States, no matter whence they came, or of what origin might be their cargoes, than were levied on national vessels under like circumstances; consequently, the United States flag is now placed on a footing of

equality, both in the direct and indirect trade, with that of Chili.

Costa Rica.—Treaty of amity, commerce, and navigation, July 10, 1851. Perpetual amity established, and the stipulations relating to navigation and commerce may be abrogated at the expiration of seven years, after the lapse of twelve months from the time that notice to that effect shall have been given by either party to the other. Vessels of the United States are placed on an equal footing with national vessels in the ports of Costa Rica as to tonnage duties, light or harbor dues, pilotage, salvage in case of damage or shipwreck, or any other local charges. Mail-packets of the United States have liberty freely and securely to come to all harbors, rivers, and places to which other foreign ships of the same description are, or may be permitted to come; to enter, anchor, and remain there, and refit, subject to the laws and statutes of the country. The coasting trade reserved by each party, respectively, to its own flag; and all favors hereafter granted to other nations by either of the two parties to become common to the other. Imports in United States vessels of articles the growth, produce, or manufacture of the United States, to be subject to the same duties as if imported in national vessels; and these duties to be no higher, nor other than are charged on similar imports the growth, produce, or manufacture of any other foreign country; similar equality of flag as to exports. By a decree of August 31, 1854, the local commercial legislation of Costa Rica was completely remodeled and materially modified. Liberty of commerce to the vessels of all nations is granted; certain descriptions of merchandise monopolized by the government, and other descriptions which are prohibited, being specified; among the latter being included rum, fire-arms, and munitions of war, which can be imported only upon special permission; and the former consisting of tobacco, gunpowder, and saltpetre, which can be admitted only on government account.

Denmark.—Convention of friendship, commerce, and navigation of April 26, 1826; ratified August 10, 1826; proclamation made October 14 of the same year. Vessels of the United States permitted to frequent all the coasts and countries of Denmark, no matter whence they may come or how they are laden, on terms of the most perfect equality as to tonnage and other charges, with the national flag, the coasting trade excepted, which is reserved by each contracting party to its own flag. This equality of flags not to apply to the northern possessions of Denmark, viz.: Iceland, the Feroe Islands, and Greenland, nor to the direct navigation between Denmark and the West India colonies of his Danish majesty. In passing the Sound or the Belts, United States vessels to pay the same dues as the most favored nation. United States vessels permitted to import into any part of his Danish majesty's dominions merchandise, whether of the growth, produce, or manufacture of the United States, or of any foreign country, on the same terms, and with the same privileges as to duties, charges, and fees of every description whatever, as apply to similar imports under the national flag; and should the merchandise be of the growth, produce, or manufacture of the United States, to be subject to no other or higher duties than similar merchandise of any other foreign country. This equality, however, not to apply to the Danish possessions of Iceland, the Feroe Islands, nor to Greenland; nor the flags to be equal in the direct trade between Denmark and her West India colonies. Merchandise in United States bottoms to pay at the Sound and Belts the same duties as similar merchandise in vessels of the most favored nation. In consequence of the onerous, and, as the United States think, the illegal taxes upon the navigation and commerce of the United States at the Sound, notice was given April 14, 1855, in accordance with the provisions of article 11 of the treaty, of the desire of the United States to terminate the same at the

expiration of twelve months from that date. The treaty accordingly "ceased and determined" April 14, 1856, and the commerce of the United States with Denmark is now unprotected by any treaty stipulations.

Ecuador.—Treaty of June 13, 1839; ratifications exchanged April 9, 1842; proclamation made by the President of the United States September 23, of the same year. To continue in force twelve years from the date of ratifications, and after the expiration of that period until the end of one year after either of the parties shall have given notice to the other of its intention to renounce it. Vessels of the United States placed on a footing of equality in the ports of Ecuador with the national flag, no matter whence they come, certain privileges in favor of vessels built in the dock-yard of Guayaquil being reserved; but these privileges also to be accorded to vessels of the United States, should they ever be granted to Spain, or to Mexico, or the other Hispano-American republics. Any favors hereafter granted to the commerce or navigation of other countries to become common to those of the United States. Imports in vessels of the United States, whether of the growth, produce, or manufacture of the United States or of any other country, subject to the same duties and charges as if imported in national vessels; and merchandise, the growth, produce, or manufacture of the United States, admitted on the same terms as similar merchandise of any other foreign country. United States commerce entitled to any privileges hereafter granted to the commerce of any other foreign nation. In all lawful commerce, whether as respects imports, exports, duties, drawbacks, etc., the United States flag enjoys an equality with the flag of Ecuador; the coasting trade and the reservation in favor of vessels built at Guayaquil excepted. Such vessels, when under the national flag, are, by decree of August 23, 1845, exempt from tonnage, anchorage, and other port dues, and are entitled to a reduction of 3 per cent. on all produce, merchandise, etc., imported by them, for consumption, into any of the ports of the republic.

France.—Convention of June 22, 1822, to be in force for two years from October 1, 1822; and after the expiration of that time, until one of the parties shall have declared its intention to renounce it; which declaration shall be made at least six months before it can take effect. Equality of treatment. Tonnage and other navigation dues in French ports upon American vessels, five francs per ton; in United States ports upon French vessels, 94 cents per ton. The navigation duty of 94 cents per ton is payable by American vessels, no matter from what port they may have last proceeded; but the equality of treatment as to cargoes with the French flag is applicable only when the voyage has been direct, and the origin of the merchandise is attested by certificate from the custom-house at the port of departure, *visé* by the French consul at such port. In French ports an extra duty on articles of the growth, produce, or manufacture of the United States, imported in American vessels, at 20 francs per ton of merchandise; in United States ports, upon similar products of France, imported in French vessels, an extra duty at \$3 75 per ton of merchandise; these extra duties not applicable in either country to merchandise of the other destined for transit or re-exportation. Should this convention be continued in force after two years, the additional duties, at the expiration of that period, to be reduced one-fourth of their amount, and successively from year to year, so long as neither nation shall give the six months' notice of its intention to renounce it. Neither party having given the notice, the additional duties ceased to exist by the annual reduction of one-fourth, from October 1, 1827. By virtue of a ministerial decree of December 17, 1851, American vessels laden with cotton for France may touch at English ports without losing the benefit of direct importation, provided bulk be not broken, and no operation of commerce be transacted. Navigation and commerce between the United

States and French colonial possessions are regulated by the laws and decrees of the French government. American vessels proceeding direct from the United States in ballast, or laden with articles the growth or manufacture of their own country, to the islands St. Pierre and Miquelon, are treated on the same footing as national vessels.

Guatemala.—Convention of peace, amity, commerce, and navigation concluded March 3, 1849, and proclaimed by the President of the United States July 28, 1852. To continue in force twelve years from the date of the exchange of ratifications; and after that period, for twelve months after either party shall have given notice to the other of its intention to renounce it. Vessels of the United States are admitted into the ports of Guatemala, no matter whence they may have sailed, on the same terms, as to tonnage and all other navigation dues, as national vessels. Any favors granted to the navigation of other foreign nations are to become common to that of the United States, on equal conditions. The coasting trade reserved by each nation to its own flag. Imports into the ports of Guatemala in vessels of the United States, whether of articles the produce, growth, or manufacture of the United States, or of any other country, placed on the same footing, as to duties and all other dues and charges, as similar imports under the national flag; and if the articles so imported are of the growth, produce, or manufacture of the United States, they are subject to no higher or other duties than similar articles, the growth, produce, or manufacture of any other foreign country. By decree of May 6, 1852, every vessel which shall anchor in the ports of Guatemala, no matter whence it may come, is required to pay a tonnage duty of twenty-five cents per ton of measurement ascertained from her papers. Among the vessels free of this duty are—vessels in ballast anchoring for supplies, and discharging no cargo; vessels of war and regular mail or steam-packets not discharging over twenty tons of cargo; and vessels receiving on board, for exportation, produce of the country, excepting cochineal.

Great Britain.—Treaty of July 3, 1815, to continue in force four years. Continued in force ten years by the 4th article of the convention of London, October 20, 1818, and renewed indefinitely April 2, 1828, with an additional article containing the usual stipulation as to twelve months' notice. "Reciprocity treaty" concluded June 5, ratified June 9, and proclaimed by President of the United States September 11, 1854. To continue in force ten years from the date at which it went into operation (1855), with the usual stipulation as to twelve months' notice after that period. It secures reciprocal freedom of fishery on the coasts of the United States and the British provinces in America, and of trade in raw products. United States vessels admitted into British ports in Europe on the same footing as national vessels. The vessels must be built and owned in the United States, and navigated by a master and a crew three-fourths of which are citizens of the United States. Vessels of the United States permitted to touch for refreshments, but not for commerce, in the course of their voyage to or from the British territory in India, or to or from the dominions of the Emperor of China, at the Cape of Good Hope, the island of St. Helena, or such other places as may be in the possession of Great Britain, in the African or Indian seas—such vessels being subject, in all that regards this article, to the laws and regulations of the British government from time to time established. Merchandise imported into British ports in United States bottoms must consist of articles the growth, produce, or manufacture of the United States; and the same duties are charged, whether imported in United States or British vessels, as on similar produce of any other foreign country. The importation, in American vessels, of the productions of any country but the United States, is prohibited. The intercourse between the

United States and the British West Indies is not affected by the treaty. The vessels of the United States are admitted into the British East India possessions on the footing of those of the most favored nation; that is, they pay the same tonnage and import duties and other charges as the vessels of such nations; but, when laden, they must proceed direct to the United States. With the British West Indies the trade was regulated, prior to 1850, by diplomatic agreement. By reciprocity treaty of 1854, a free trade in the raw staples of the United States and Canada, Newfoundland, New Brunswick, Nova Scotia, and Prince Edward Island, respectively, is established. By the act 12 and 13 Victoria, chapter 29, which went into force January 1, 1850, the comprehensive principle was adopted of admitting into the ports of Great Britain, and of British possessions, goods of any sort, in a ship of any country, from any part of the world; certain restrictions, deemed necessary either for the safety of the state or for the protection of the revenue, still remaining in force. American vessels in British ports are, therefore, equalized with British vessels as to tonnage and import duties, and all other charges whatever. By circular of the Treasury Department of the United States, October 15, 1849, instructions were issued to custom-house officers and others interested, as follows: "1. In consequence of the alteration of the British navigation laws, British vessels from British or other foreign ports will (under our existing laws), after the first day of January next, be allowed to enter in our ports with cargoes of the growth, production, or manufacture of any part of the world. 2. Such vessels and their cargoes will be admitted, from and after the date before mentioned, on the same terms as to duties, imposts and charges, as vessels of the United States and their cargoes. By the act 17 Victoria, chapter 5, the coasting trade of Great Britain is opened to foreign flags, subject only to the same regulations as apply to British vessels engaged in the same trade.

Hanover.—Treaty of June 10, 1846, to continue in force twelve years from date; and further, until either party gives to the other twelve months' notice of its intention to renounce it at the expiration of the period. Vessels of the United States received in Hanoverian ports on the same terms, as to navigation dues of every description, as national vessels; and, in the navigation of the River Elbe, are equalized with Hanoverian vessels as to the tolls collected at Brunshausen or Stade. Whatever merchandise or produce may be imported in Hanoverian vessels may also be imported in United States vessels, on terms of perfect equality as to duties, irrespective of the country of origin, or whence imported. The equality guaranteed by the treaty extends only to such vessels of the high contracting parties as are built within their respective territories, or lawfully condemned as prizes of war, or adjudged to be forfeited. It is also stipulated that vessels of the kingdom of Hanover may select their crews from any of the states of the Germanic Confederation, provided that the masters of each be a subject of the kingdom of Hanover.

Hanse Towns.—Treaty of December 20, 1827, to continue in force twelve years from date; either party reserving the right, after the expiration of that period, to renounce the treaty at the end of twelve months, after having given notice of its intention to do so. Navigation duties of every description whatever, the same on United States vessels as on national, whether in the direct or indirect trade; and perfect equality in all other respects. Imports into the ports of the Hanse Towns in vessels of the United States, subject to the same duties, charges, etc., as similar imports under the flag of the Hanse Towns. Each one of the three Hanseatic towns, Hamburg, Bremen, and Lübeck, agrees separately, and each for itself, to the stipulations of the treaty. Hanseatic vessels are entitled to equality in the ports of the United States with the national flag,

if owned exclusively by a citizen or citizens of any or either of the Hanse Towns, and of which the master shall also be a citizen of any or either of them, and provided that three-fourths of the crew shall be citizens or subjects of any or either of the said republics or towns, or of any or either of the states of the Germanic Confederation. This privilege secures to the flag of the Hanse Towns a large share of the carrying trade between the United States and the German states.

Holland.—Treaty of August 26, 1852, additional to that of January 19, 1839, and substituting for articles 1 and 2 of the latter treaty other articles; and providing that the duration of the new treaty shall be limited to the term of two years from the date of ratification (February 25, 1853), with the usual twelve months' notice. Vessels of the United States, whencesoever coming, are treated in Dutch ports, including also the foreign possessions of Holland, as national vessels, with respect to duties of tonnage, harbor dues, light-house, pilotage, quarantine, or other port charges of any kind whatever—the coasting trade and national fisheries being reserved. Entire reciprocity guaranteed to the flag of the United States, and perfect equality with the national flag, as to the duties of import and export, both in Dutch ports in Europe and in those of Dutch possessions abroad. All differential and discriminating duties as respects the flag are abolished. The equality as to export duties, stipulated in the treaty of 1852, applies only when the vessels of the United States clear for the same ports as national vessels. Thus the export duty on coffee in Java is the same when exported in United States bottoms as when exported in Dutch vessels, when both have the same destination; but if the Dutch vessel proceeds to Amsterdam, and the United States vessel clears for Boston, the former enjoys a discriminating privilege in respect of the amount of duty.

Japan.—Treaty concluded March 31, 1854; ratifications exchanged February 21, 1855; and proclamation made by the President of the United States June 22 of the same year. American vessels permitted to enter the ports of Hakodade and Simoda, and no other ports of the Japanese empire, unless in distress, or forced by stress of weather. The only charge for entering is for pilotage, the rates of which, for the port of Simoda, are as follows: Vessels drawing over 18 feet pay \$15; over 13, and less than 18, \$10; under 13, \$5. Vessels of the United States are permitted to exchange only gold and silver coin, and articles of goods for other articles of goods, under such regulations as shall be temporarily established by the Japanese government. Wood, water, provisions, coal, and goods required, can only be procured through the agency of Japanese officers, appointed for that purpose. As a means of opening the commerce of Japan, or even of the ports opened to American vessels—viz., Simoda and Hakodade—the treaty has proved totally inefficient. The treaty grants the privilege to shipwrecked persons and other citizens of the United States, living temporarily at Simoda, to go where they please within the limits of seven Japanese miles from a small island in the harbor, and at Hakodade within limits hereafter to be defined. "Living temporarily" has been defined by the Japanese authorities to mean "a sojourn of four or five days on shore." Wood and water, and such supplies as could be had, have been freely sold at pretty good prices; but permission to trade, in a mercantile sense, has been absolutely refused. The privileges of this treaty are said to have been recently extended to all nations.

Mecklenburg Schwerin.—Declaration of accession to treaty with Hanover, December 9, 1847, to continue in force until June 10, 1858, with the usual twelve months' notice stipulation after that period, and a conditional six months' notice by the United States, if a contingency should occur rendering it expedient, in the opinion of that government, to renounce the treaty. Vessels of

the United States subject to the same duties in the ports of the Grand Duchy of Mecklenburg Schwerin as national vessels; the coasting trade being reserved. This equality applies only to vessels built within the respective territories of each party, or lawfully condemned as prizes of war, or adjudged to be forfeited, etc., and belonging wholly to citizens of each. Importations of articles the growth, produce, or manufacture of the United States, subject to no higher duties than similar articles the growth, produce, or manufacture of any other foreign country; such duties to be the same, whether imported in vessels of the United States or in national vessels. This equality is applicable to the indirect as well as to the direct trade. Besides the stipulations contained in the treaty with Hanover, other articles are added. Import duty on raw cotton and paddy, the produce of the United States, is abolished by the treaty; and maximum rates of import duty on tobacco, rice, and whale-oil, and for transit on the Berlin-Hamburg railroad, are prescribed.

Mexico.—Treaty of April 5, 1831, revived, as to general stipulations relating to commerce and navigation, by article 17 of the treaty of February 2, 1848, and to continue in force from date of ratification of said treaty (May 30, 1848) for a period of eight years, with the usual stipulation providing for twelve months' notice after that period by either party wishing to renounce it. Vessels of the United States may enter all the open ports of the Mexican republic on the same terms, as to tonnage duties, light or harbor dues, pilotage, salvage, and all other local charges, as apply to national vessels. The coasting trade is reserved by each country, respectively, to its own flag. United States vessels may import into Mexican ports merchandise, the growth, produce, or manufacture of the United States, on the same terms as if the said merchandise were imported under the national flag; the duties of import to be no higher or other than levied on similar merchandise, the growth, produce, or manufacture of the most favored nation.

Morocco.—Treaty concluded September 16, 1836, and proclamation thereof made by the President of the United States January 30, 1837; to continue in force fifty years, with the usual stipulation requiring twelve months' notice after that period by either party wishing to renounce it. United States vessels permitted to put into any ports in the dominions of the Emperor of Morocco for provisions or other supplies, without any interruption or molestation, and to put in for repairs, and to land and reload their cargoes, without paying any duty whatever. Should American vessels be cast ashore on any part of the coasts of Morocco, either by stress of weather or other cause, to be permitted to remain undisturbed until the commander may think proper to proceed on his voyage. Importations from the United States, and American commerce generally, to be on the same footing as those from Spain, or from the most favored nation for the time being. Masters forbidden to transport their cargoes on board other vessels. Merchants of the United States allowed to employ such interpreters and other agents as they shall think proper; and American citizens permitted to pass and repass the country and sea-ports whenever they please, without molestation. The tariff of duties is often arbitrarily raised in Morocco. The general rate is 10 per cent. on imports, excepting certain specified articles, on which specific duties are levied. (Tobacco is a monopoly of the government, and the trade is usually rented out at rates reaching as high as \$100,000 per annum. Were the trade in this article freed from the pressure of this monopoly, its importation from the United States would be largely increased.)

Muscat.—Treaty of September 21, 1833; President's proclamation issued June 24, 1837. Establishes perpetual peace between the United States and his majesty the Sultan of Muscat and his dominions. Vessels of the United States pay 5 per cent. duties on the car-

goes landed, to be in full of all duties of import and export, tonnage, license to trade, pilotage, anchorage, or of any other charge whatever. No charge to be paid by American vessels entering any of the sultan's ports for the purpose of refitting, or refreshments, or to inquire the state of the market. The duties and other charges on commerce in the dominions of the sultan are given under the head of Navigation. The articles of muskets, powder, and balls, can be sold only to the government, in the island of Zanzibar; but in other ports of the sultan's dominions said munitions of war may be sold to the highest bidder without restriction. Duties of tonnage, import and export, license to trade, etc., to be the same for American citizens as for citizens of the most favored nation. The trade between the United States and the dominions of the Sultan of Muscat, especially the island of Zanzibar, is yearly increasing. It reaches annually in value about \$1,000,000, and is carried on chiefly from Salem, Massachusetts. Articles of American manufacture most in demand in the market of Zanzibar are the various descriptions of cotton goods, the annual exportation amounting to about 6000 bales. Every facility for commercial operations is extended to American vessels and mercantile houses, and the duties or other charges never exceed those stipulated in the treaty.

New Granada.—Treaty of December 12, 1846, to continue in force twenty years, unless either party should notify the other, twelve months before the expiration of that period, of its intention to reform any or all of its stipulations; and beyond that period, for twelve months after either shall have given notice of its intention to propose such modifications. Vessels of the United States to enter all the ports of New Granada on a footing of entire equality with the vessels of that republic, without regard to the port or country whence they may have sailed. Should such vessels be driven into the ports of the republic by pirates, enemies, or from stress of weather, to be protected, and all facilities, etc., afforded them; and, unless they remain in port over forty-eight hours, to be exempt from all port or harbor charges, pilotage excepted. The coasting trade reserved by each of the contracting parties to its own flag. Duties on imports and exports under the United States flag the same as under the national flag; and on articles the growth, produce, or manufacture of the United States, these duties not to be higher or other than are levied upon similar articles, the growth, produce, or manufacture of any other foreign country. Merchandise belonging to citizens of the United States, in transit across the Isthmus of Panama, to be free from import duties, and subject only to the same tolls that are levied in like cases on merchandise belonging to citizens of New Granada. For the privileges granted on the Isthmus of Panama, the United States guarantee to New Granada the perfect neutrality of that territory, and her sovereignty and rights of property over the same. The stipulations of the treaty respecting commerce have been modified by subsequent decrees of the government of New Granada. Those of chief interest provide that the coasting trade shall be thrown open to all flags, and payment of navigation duties shall be demanded only at one port. Panama, Cartagena, Choco, Buenaventura, and Yumaco, are free ports—no other than navigation duties being charged. More recent enactments, however, impose a tonnage duty of 40 cents per ton on all vessels entering port; and a tax of \$3 per pound on all mail matter crossing the Isthmus.

Oldenburg.—Declaration of accession of the Grand Duke of Oldenburg to treaty with Hanover, March 10, 1847. The same stipulations and privileges as are granted under the treaty with Hanover of June 10, 1846. The same privileges, as respects the commerce of the United States, as are extended to said commerce in Hanoverian ports. The stipulations relative to the Stade and Weser tolls, contained in the treaty between

the United States and Hanover, are omitted in the declaration of accession by Oldenburg; this government having no control over, or interest in, said tolls.

Peru.—Treaty of July 26, 1851; ratifications exchanged the 16th, and proclamation made by President of the United States the 19th July, 1852. To continue in force ten years from date of ratification; and beyond that period, until twelve months shall have elapsed after either party shall have given the other notice of its intention to renounce it. No higher or other duties or charges on account of tonnage, light-houses, or harbor dues, pilotage, quarantine, salvage, etc., to be levied on United States vessels of 200 tons or upward, than are payable in the same ports on national vessels of the same tonnage. The coasting trade is reserved by each country, respectively, to its own flag. Imports in vessels of the United States to be subject to the same duties as similar imports in national vessels; and if of the growth or manufacture of the United States, the duties to be no higher or other than on similar merchandise the growth or manufacture of any other nation. Like equality of flags as to exports. Should the tariff of Peru be changed so as to augment the duties of import or export, such change not to apply to United States commerce until the expiration of eight calendar months thereafter. Steam-vessels of the United States, if belonging to a regular line owned by citizens of the United States, to be permitted to navigate the ports of entry of Peru with the same privilege as any association or company whatsoever. The treaty provides that whale-ships of the United States shall have access to the port of Tumbes, as well as to the ports of entry of Peru, and may sail from one port to another for the purposes of refreshment and refitting; and shall be permitted to sell or barter their supplies or goods, including oil, to the amount of \$200 *ad valorem* for each vessel, without paying any tonnage or harbor dues, or any duties or imposts upon the articles so sold or bartered. They shall be permitted, with like exemption from tonnage and harbor dues, to sell or barter supplies or goods, including oil, to the additional amount of \$1000 *ad valorem* for each vessel, upon payment, on said additional articles, of the same duties as are payable upon like supplies or goods and oil when imported in the vessels and by the citizens of the most favored nation. A decree of the Peruvian government restricts the terms "supplies or goods, including oil," to articles the produce of the fisheries, and withholds the privileges of the stipulations of the treaty, above condensed, from all other descriptions of "goods" or merchandise.

Portugal.—Treaty of August 26, 1840; ratifications exchanged April 23, 1841; and proclamation made April 24 of the same year; to continue in force six years from date of ratifications; and further, until the end of one year after either of the contracting parties shall have given notice to the other of its intention to renounce it. Vessels of the United States arriving, either laden or in ballast, in the ports of Portugal (including Portuguese possessions), to be treated on an equal footing with national vessels coming from the same place, with respect to the duties of tonnage, light-house dues, pilotage, port charges, and all other charges whatever. Each party reserves to its own flag, respectively, the coasting trade. On the importation into the kingdom of Portugal and its possessions, where foreign commerce is allowed, in vessels of the United States, of any articles the growth, produce, or manufacture of the United States, no other or higher duties to be levied than on similar articles the growth, produce, or manufacture of any other foreign country; and, in all cases of direct importation, the vessels of each country to be equalized in the ports of the other. Should the indirect trade of any other foreign country be placed upon the same footing as the direct trade, similar privileges to be accorded to the United States on equal conditions. Any favor granted since the date

of the treaty, or which may hereafter be granted by either of the high contracting parties, as respects commerce and navigation, is to apply to the other party, freely if it has been freely granted, and on similar equivalents where it has been conditional. By virtue of the reciprocity, as it respects navigation, Portuguese vessels are exempt from tonnage duty in the ports of the United States. In the indirect trade with Portugal, imports under the United States flag are subject to differential duties.

Prussia.—Treaty of May 1, 1828, to continue in force twelve years, with the usual stipulation requiring twelve months' notice after that period by either party desiring to renounce it. United States vessels to be treated in Prussian ports, as to the duties of tonnage, light-houses, pilotage, salvage, and port-charges, as well as to all other duties, fees, or charges whatsoever, as national vessels. The coasting trade reserved to each country. Cargoes under the United States flag, whatever the origin, or whencesoever imported, to be subject to the same duties and charges only as if imported under the national flag. Like equality as to exports. Articles the growth, produce, or manufacture of the United States, to be subject to the same duties as like articles the growth, produce, or manufacture of any other foreign country. Two treaties of amity and commerce were entered into between the United States and Prussia prior to that condensed above—one of July, August, and September, 1785; and the other of July 11, 1799. By article 12 of the treaty of May 1, 1828, the 12th article of the former treaty, and from the 18th article to the 24th, inclusive, of the latter, with the exception of the last paragraph in article 19, are revived, in so far as they do not affect treaties or conventions concluded by either party with other powers, during the interval between the expiration of the treaty of 1799 and the commencement of the treaty of 1828. Articles 12 of the treaties of 1785 and 1799, respectively, relate to the principle of free ships making free goods. In reference to this point, article 12 of the treaty of 1828 provides that, the parties being still desirous to establish between themselves, or in concert with other maritime powers, further provisions to insure just protection and freedom to neutral navigation and commerce, and which may, at the same time, advance the causes of civilization and humanity, engage again to treat on this subject at some future and convenient period.

Russia.—Treaty of December 6 [18], 1832, to continue in force until January 1, 1839, with the usual stipulation for twelve months' notice to renounce it by either party desiring to do so. No such notice having been given, the treaty continues in force. United States vessels arriving in Russian ports, either laden or in ballast, to be treated on the same footing as national vessels, coming from the same place, with respect to duties of tonnage. In regard to light-house duties, pilotage, and port charges, as well as to the fees and perquisites of public officers, and all other duties and charges levied upon vessels of commerce, the United States flag is placed upon the footing of the most favored nation with which Russia has no special treaty stipulating for entire reciprocity. Any favors hereafter granted to the navigation of any other foreign nation, to become common to the United States on similar or equal conditions. All kinds of merchandise and articles of commerce, being the growth, produce, or manufacture of the United States, may be imported into Russian ports on the same terms as apply to similar articles the produce or manufacture of any other foreign country; and, whether the imports be of the growth, produce, or manufacture of the United States, or of any other foreign country, perfect equality is granted with the national flag. Any favor hereafter granted to the commerce of other foreign nations to become common to the commerce of the United States. Certain special privileges to be retained by Russia in reference to com-

merce with Prussia, and Sweden and Norway; but they do not affect the general reciprocity stipulated in the treaty. The treaty establishes entire reciprocity between the flags of the two countries. July 22, 1854, a treaty was concluded between Russia and the United States, establishing the principle that "free ships make free goods," and containing a stipulation to the effect that other nations may, by a formal declaration of a desire to accept and be governed by the principle, become entitled to all the resulting rights and privileges. The Russian government, under date November 28, 1856, officially signifies to the government of the United States its adhesion to the principles announced in the reply of the latter government to the declarations of the Congress at Paris, April 16, 1856, in reference to privateering. The communication of the representative of the Russian government at Washington thus conveys the concurrence of the emperor: "His majesty entirely concurs in the views of the government of the United States which the Hon. Mr. Marcy has laid down in his equally lucid as temperate note of the 28th of July. The proposition of the federal government, in the opinion of his imperial majesty, deserves so much the more to be taken into consideration that the honorable Secretary of State argues not for the exclusive interest of the United States, but for those of the whole of mankind. The undersigned is accordingly instructed to notify the Hon. Mr. Marcy that his majesty the emperor accepts, for his part, the condition under which the United States consent to the abolition of privateering—namely, that the private property of the subjects and citizens of the contracting parties shall in times of war be respected by their respective naval forces, as well as by those of all the powers which may join in this declaration."

San Salvador.—Convention concluded January 2, 1850. To continue in force twenty years, if neither party notify the other twelve months before the expiration of that period of its desire to reform any of its stipulations; and beyond twenty years, until twelve months shall have elapsed after such notice shall have been given by either party. Vessels of the United States, no matter whence they may have come, or how laden, to be treated in the ports of San Salvador, as to all duties of tonnage, light-house, or any other charges of whatsoever denomination or character, as national vessels. From this equality the coasting trade is excepted, which is reserved to the national flag; but should any favors of navigation be granted hereafter to any other foreign nation, it will immediately apply to the flag of the United States. Imports into San Salvador in vessels of the United States, no matter whence imported or of what origin, to be subject to the same duties, charges, and fees of every description, as similar imports in vessels of San Salvador; and if these imports consist of articles the growth, produce, or manufacture of the United States, to be subject to no higher or other duties than similar imports, the growth, produce, or manufacture of any other foreign nation.

Sandwich Islands.—Treaty concluded December 20, 1849; ratifications exchanged August 24, 1850, and proclamation made by the President of the United States November 9, 1850. Establishes perpetual peace and amity between the United States and the Hawaiian Islands, and provides that the treaty shall continue in force ten years, with the usual stipulation providing for twelve months' notice by either party wishing to renounce it after that period. United States vessels in direct voyages, if laden, or in respect of any voyage, if in ballast, to pay the same duties of tonnage, harbor, light-houses, pilotage, quarantine, or other navigation charges of whatever kind, that are paid by national vessels. Steam vessels employed in carrying the public mails of the United States across the Pacific, or from one port to another therein, to have free access to the ports of the Sandwich Islands, to refit, refresh, land passengers and their baggage, or for any purpose per-

taining to the mail service of the United States, without being subject to any of the duties above specified. Whale-ships of the United States may enter the ports of Hilo, Kealahakua, and Hanalei, and also the open ports of Honolulu and Lahaina, exempt from tonnage or harbor dues of any description, with certain privileges of trade, as set forth herewith. They may also pass from port to port of the islands for the purpose of procuring refreshments, but may not land their seamen or passengers, except at Honolulu or Lahaina. The privilege of the same ports is also granted to armed vessels of the United States. Imports of merchandise, the growth, produce, or manufacture of the United States, to be subject to the same duties, whether imported in vessels of the one country or of the other; and these duties to be the same as are levied upon similar merchandise, the growth, produce, or manufacture of, or imported from, any other country. Absolute liberty of trade allowed between the citizens of the two countries, without restriction, unless in articles prohibited. Whaling vessels of the United States may trade or barter their supplies or goods, except spirituous liquors, to the amount of \$200 *ad valorem* for each vessel, without being liable to pay duties therefor; and the further privilege is granted to such vessels at the ports designated above, and exempt, as therein stated, from tonnage and harbor dues, to trade or barter, except in spirituous liquors, to the further amount of \$1000 *ad valorem*, by paying on the additional goods so traded or bartered the usual duties levied on similar merchandise imported under the flag of the most favored nation.

Sardinia.—Treaty of November 26, 1833, to continue in force ten years from March 13, 1833—the date of exchange of ratifications; and, after the expiration of that period, until twelve months shall have elapsed after either party shall have given notice to the other of its intention to renounce it. Vessels of the United States arriving in Sardinian ports, either laden or in ballast, to be treated, as to the duties of tonnage, light-houses, pilotage, and port charges, as well as to all fees and charges of whatever kind or denomination, as national vessels coming from the same place. All imports in United States vessels into Sardinian ports to pay the same duties and charges only as if brought in Sardinian vessels. Imports, the growth or manufacture of the United States, to pay the same duties only as like produce of the most favored nation. The "Separate Article" of the treaty, respecting "differential duties," ceased to have effect, by virtue of a law of Sardinia, July 6, 1860. Freedom of transitsage, from and to the port of Genoa, through the territories of Sardinia, is stipulated by the treaty, with specified exceptions.

Sweden and Norway.—Treaty of July 4, 1827, reviving certain articles of the treaty of April 3, 1783, together with the 1st, 2d, 4th, and 5th separate articles of the said treaty, and containing additional commercial stipulations; to continue in force ten years, with the usual stipulation requiring twelve months' notice to be given by either party desiring to renounce it, after the expiration of that period. Vessels of the United States proceeding from any port to the ports of Sweden and Norway, including those of the island of St. Bartholomew, laden or in ballast, are treated as national vessels coming from the same port, as to all duties of navigation and tonnage. Entire reciprocity and perfect equality, as to import duties and all other charges, between the flag of the United States and that of Sweden and Norway; and this reciprocity and equality applies, whether the voyage be direct from the ports of the United States, or indirect from any other foreign port.

Switzerland.—Convention signed November 25, 1850; ratifications exchanged November 8, 1855; and proclamation made November 9 of the same year. To continue in force ten years from date of ratification, if neither party gives notice to the other one year before

the expiration of that period; and so on from year to year, until the expiration of twelve months after such notice shall have been given. Imports and exports to and from Switzerland take place through the ports and territories of France and other adjacent countries; and the charges of transitsage, in consequence, are a heavy drawback upon the industry and commerce of the confederation. This remark applies especially to the restrictions on transitsage through France. In all that relates to the importation, exportation, and transit of their respective products, the United States and the Swiss Confederation to treat each other reciprocally as the most favored nation, union of nations, etc. All future commercial privileges granted by either party to any nation, union of nations, etc., immediately to become common to the other party on equal conditions. Should differential duties be established in the Swiss Confederacy upon the products of any nation, the United States to be at liberty to determine the manner of establishing the origin of its own products destined to enter that confederacy. The frontier territory of Switzerland is divided into six departments for the collection of customs duties. The central points of these, respectively, are at Basle, Schaffhausen, Coire, Lugano, Lausanne, and Geneva. No merchandise can be imported or exported, unless by special license, except through one or other of those frontier custom-houses.

Siam.—Treaty of amity and commerce of March 20, 1833; ratifications exchanged April 14, 1836; and proclamation made by the President of the United States June 24, 1837. Establishes perpetual peace between the United States and Siam. Vessels of the United States entering any port of the Siamese dominions, and selling or purchasing cargoes of merchandise, to pay, in lieu of all import and export duties, tonnage, license to trade, or any other charges whatsoever, a measurement duty of 1700 ticals, or bats (equal to \$1037), for every fathom of 78 English inches in breadth upon vessels selling merchandise, and of 1500 ticals (equal to \$915) per fathom, similar measurement, upon vessels purchasing cargoes with specie. It is prohibited to sell munitions of war to any person except the king, and also to export rice or import opium, the latter being contraband. It is stipulated that if hereafter the duties payable by foreign vessels be diminished in favor of any other nation, the vessels of the United States shall be entitled to like diminution; and should any foreign nation, other than Portugal, be hereafter permitted to have consuls in Siam, the same privilege shall be accorded to the United States. United States merchants, desirous of bringing their goods on shore for trade, must deposit them in the king's factories, paying the customary rent of the country therefor. The treaty of 1833 completely suspended all commercial operations between the United States and Siam. On a vessel, say of 25 feet beam, the duty, at 1700 ticals per 78 inches, would amount to \$3988 46! In 1855 (April) a new treaty was negotiated between Great Britain and Siam, to the privileges of which American commerce is entitled by article 4 of the treaty of 1833 between the United States and Siam. This new treaty with Great Britain authorizes that nation to have a resident consul at Bangkok, after April 6, 1856; and after the same date the measurement duty is to be abolished, and a general import duty of 3 per cent. to be paid in money or kind, at the option of the importer. Disputes as to the value of goods are to be settled by arbitrators. Opium may be imported free, but can be sold only to the opium farmer or his agent. Export duty specific.

Tripoli.—Treaty of peace and amity of June 4, 1805, not limited as to duration. Establishes a firm, inviolable, and universal peace, and a sincere friendship "on the terms of the most favored nation," and guarantees to the United States like favors with those hereafter granted to any other nation. Vessels of the United States in the ports of Tripoli to be subject to

the same duties, charges, and privileges as the vessels of the most favored nation. United States vessels destined for Tripolitan ports must be provided with proper passports; to examine which, not more than two persons, besides the rowers, are allowed to proceed from any Tripolitan man-of-war, or to go on board, unless permitted so to do by the American captain. In case of distress, United States vessels may put in, land and re-embark cargo, and repair, without the payment of duties. The commerce between the United States and Tripoli—the protection to be given to American merchants, masters of vessels, and seamen—the right of establishing consuls in the regency of Tripoli, and the privileges, immunities, and jurisdictions enjoyed by such consuls, to be on the same footing with those of the most favored nation.

Two Sicilies.—Treaty of December 1, 1845, to be in force ten years from date, either party reserving the right to terminate it after that period, on giving twelve months' notice of its intention to do so. When importing articles of the growth or the manufacture of the United States, American vessels to be on the same footing as to duties, charges, etc., with national vessels. This equality as to navigation dues applies only in respect of direct voyages if laden, or of any voyage if in ballast. Merchant vessels of the United States, forced by stress of weather, or other similar cause, into Sicilian ports, to be exempt from port and tonnage duties, provided no operation of commerce is carried on. The coasting trade is reserved by each country to its own vessels. The direct importation of articles of the growth, produce, or manufacture of the United States to be subject to the same duty, whether imported in vessels of the United States or in those of the Two Sicilies. In the indirect trade, importations under the flag of the United States into the ports of the Two Sicilies to be subject to differential duties. A decree was issued, December 18, 1864, by the King of the Two Sicilies, extending to the indirect trade of such foreign nations as would be willing to reciprocate all the advantages of the national flag. Under the act of 1828, previously given at length in the *article SICILY*, page 1714, the government of the United States has reciprocated the privileges thus granted by the government of the Two Sicilies; and the flag of the United States is therefore equalized, in Sicilian ports, with the national flag in the indirect trade.

Turkey.—Treaty concluded May 7, 1830, and ratified February 2, 1831. Not limited as to duration. Vessels of the United States to be treated, in ports of the Ottoman empire, in like manner as vessels of the most favored nation; to have the same liberty to pass the canal of the imperial residence, and to go into and come from the Black Sea, either laden or in ballast; and may be laden with the produce, manufactures, and effects of the Ottoman empire, except such as are prohibited, as well as with those of their own country. United States vessels must sail under their own flag, and are prohibited from lending their flag to the vessels of other foreign nations, or to those of the rajahs. Importations into Ottoman ports in vessels of the United States to be subject to the same duties, charges, etc., as importations under the flag of the most favored nation. American merchants established in the states of the Sublime Porte for purposes of commerce, to be at liberty to employ *sensars*—brokers or factors—of any nation or religion; such merchants or other American citizens residing in the Turkish dominions not to be amenable to Turkish tribunals for offenses committed, but to be tried by their own minister or consul, and punished according to his sentence. By virtue of the most favored-nation stipulation, vessels of the Ottoman Porte are admitted into United States ports on the same terms as American vessels. Duties, according to the tariff of the Ottoman Porte, are based upon the *ad valorem* principle; and the treaty nations usually name commissioners every five or six years, who, in

concert with a commission named by the Sublime Porte, regulate the "fixed values" of merchandise imported. The present rates were fixed by a British commission of this character; and, in regard to many articles of American importation, especially cottons and rum, the mode of valuation works a practical discrimination, which can be remedied only by the action of an American commission remodeling existing valuations, as respects the manufactures of the United States.

Tunis.—Treaty of August, 1797, modified by convention of March 26, 1799, and by subsequent treaty of February 24, 1824. Establishes perpetual peace and friendship between the United States and the Bey of Tunis. Vessels of the United States permitted to enter all the ports of the kingdom of Tunis on paying the usual duties which are paid by the vessels of the most favored nations: Should the government of Tunis have need of the services of an American vessel not previously engaged, it must have the preference on paying the same freight that is usual with merchants for the same service. Commerce with Tunis under the United States flag to be conducted on precisely the same footing, as to import duties, fees, and all charges whatsoever, as is commerce under the flag of the most favored nation. American merchants to be permitted to establish themselves, transact their own business, or appoint their agents, factors, etc., in the territories belonging to the kingdom of Tunis.

Venezuela.—Treaty of peace, friendship, navigation, and commerce, concluded January 20, 1836; ratified May 31, and proclamation made by President of the United States June 30, of the same year. To continue in force twelve years from date of ratifications; and further, until either party gives twelve months' notice of its intention to renounce it. Vessels of the United States, no matter whence they come, or with what laden, to be on a footing with national vessels. The same equality, including bounties, duties, and drawbacks, to apply in regard to exportation or re-exportation. Vessels of the United States shipwrecked, foundered, or in any other way damaged, on the coasts, or within the dominions of Venezuela, to receive all necessary assistance and protection. Whatever may be imported in Venezuelan vessels may also be imported in vessels of the United States, and on the same terms, as to duties and all other charges. The same equality as to exports. Articles, the growth, produce, or manufacture of the United States, to be subject in Venezuela to no higher or other duties than similar articles, the growth, produce, or manufacture of any other foreign country. All favors hereafter granted to other foreign nations to apply equally to the United States on similar conditions. The customs, tariffs, and commercial regulations of Venezuela are subject to frequent, and, occasionally, onerous changes. The latest of these—that of April 27, 1856—imposes an extraordinary contribution upon certain imports and exports, to take effect from and after July 1, 1856. Among the exports thus affected are coffee, cocoa, indigo, hides, quinia, sarsaparilla, dye-wood, etc. The extraordinary import duty is 20 per cent. on the amount of regular duties, and 15 per cent. on all articles that are included in the free list, excepting gold and silver in bars, bullion, or dust, printing-presses, printed books, machinery, etc.—*Com. Relat. U. S.*

Trebizond, anciently Trapezus, from its resemblance to a trapezium, a town of Asia Minor, on the southeast coast of the Black Sea, lat. 40° 1' N., long. 39° 44' 52" E. Population variously estimated at from 15,000 to 30,000. The town is built on the declivity of a hill rising gently from the sea. It is a place of great antiquity; and, from the year 1203 to the final subversion of the Eastern empire by Mohammed II. in the 15th century, was the seat of a dukedom, or, as it was sometimes called, an empire, comprising the country between the Phasis and the Halys. Its fortifications are still of considerable strength, at least for a

Turkish city. The space included within the walls is of great extent; but it is principally filled with gardens and groves. The houses are mean in their outward appearance, and comfortless within.—TOURNEFORT, *Voyage du Levant*; KINNEER'S *Journey through Asia Minor*.—Trebizond has two ports, one on the west and one on the east side of a small peninsula, or point of land, projecting a short way into the sea. That on the east is the best sheltered, and is the place of anchorage for the largest ships. It is, however, exposed to all but the southerly gales; but it does not appear that, with ordinary precaution, any danger need be apprehended. The ground, from one-fourth to half a mile east from the point, is clean, and holds extremely well. Ships moor with open hawse to the north, and a good hawser and stream anchor on shore, as a stern-fast. At night the wind always comes off the land. Captain Middleton says that the only bad weather is from the northwest; but that, though the swell be considerable, it does not cause any heavy strain upon the cables.—*Nautical Magazine*, vol. ii. p. 181.—At Platana, near Trebizond, and quite as exposed, Turkish vessels have from time immemorial rode in safety the whole winter; a satisfactory proof that the danger supposed to be incident to the roads along the coast is wholly visionary.—*Ibid*.

Trade.—In antiquity, and in more modern times, previously to the conquest of Constantinople by the Turks, and the exclusion of all foreign vessels from the Black Sea, Trebizond was the seat of an extensive trade. Any one, indeed, who casts his eye over a map of Western Asia must be satisfied that this city is the natural emporium of all the countries to the southeast of the Black Sea, from Kars on the east, round by Diarbeker to Amasia on the west. Erzeroum, the principal city of Armenia, is only about 135 miles southeast from Trebizond. Its merchants are distinguished by their superior attainments, and by their enterprise and activity. For a lengthened period they derived most part of their supplies of European commodities by way of Smyrna or Constantinople: nothing, however, but the impossibility of obtaining them at so convenient a port as Trebizond could have made them resort to such distant markets as those now mentioned; and it may well excite surprise, considering the period during which the Black Sea has been open, that efforts were not sooner made to establish an intercourse with Armenia, Georgia, and the northwestern parts of Persia, through this channel. We are glad, however, to have to state, that within these few years this has been done, and, notwithstanding the difficulties that necessarily attach to every attempt to open new channels of commerce with semi-civilized nations, the experiment has proved more than ordinarily successful. The policy of Russia has, of late years, given to Trebizond an importance it did not formerly possess. Previously to the 1st of January, 1832, the trade between Europe and Persia, by way of the Black Sea, principally centred in the Russian port of Redout Kalé, at the mouth of the Phasis. This was a consequence of the exemption granted in 1822 to the Russian provinces to the south of the Caucasus from the duties charged in the other parts of the empire. But the exemption having ceased at the period referred to, and the trans-Caucasian provinces having been subjected to the same duties as the other provinces, the transit trade to Persia by way of Redout Kalé, Teflis, and the Caspian Sea, almost entirely ceased, and it is now carried on through Trebizond, Erzeroum, and Tabreez. In consequence, the increase of trade at Trebizond has been very remarkable.

Of the exports, silk is by far the most important; and next to it are nuts, saffron, tobacco, copper, wax, shawls, beans, galls, leeches, etc. Their total value was estimated in 1846 at £479,874, of which silk made nearly a half, or £210,080. See TURKEY.

Tree-nails, certain long cylindrical wooden pins

employed to connect the planks of the ship's side and bottom to the corresponding timbers. They are superior to spike-nails or bolts of iron, which are liable to rust and loosen. The thickness of the tree-nails is usually proportioned to the length of the ship, allowing one inch to every hundred feet.

Trees (*Age of*). Among others mentioned in an article in the *American Almanac* for 1838, p. 102, are, the Wallace oak at Ellerslie, Scotland, 700 years. (Some oaks are supposed to have lived 1500 years.) Oak on estate of James Wadsworth, Genesee, New York, 500 years. Few trees at Fountain's Abbey, England, 1200 years; and in Scotland, said to be 2500 years. Elms, in Switzerland, 335 years. Cedars on Lebanon, 800 years. Olives, in the Garden of Olives, Jerusalem, 800 years. *Banians*, in Hindostan, 3000 years. *Cypresses*, at Grenada, 800 years.

Tret. In Commerce, an allowance of 4 lbs. for every 104 lbs. for the waste which certain kinds of goods are liable to from dust, etc.

Trieste, a city and sea-port of the Austrian dominions, the capital of a district of Illyria, situated near the northeast extremity of the Gulf of Venice, lat. (of light-house) 45° 38' 6" N., long. 13° 46' 5" E. Population in 1850-'51, of the city only, 50,000 (?), and including the district comprised within the limits of the free port, 82,596. It is divided into the old and new towns. The former is built upon elevated ground; the latter, which is lower down, is laid out with greater regularity, and is partly intersected by a canal, into which vessels not drawing more than nine or ten feet water enter to load and unload. The harbor of Trieste, though rather limited in size, is easy of access, and convenient. It is protected from southerly gales by the *Molo Teresiano*, so called from the Empress Maria Theresa, at the extremity of which the new light-house, mentioned below, has been constructed. The port, with the mole, forms a crescent one and a half mile in length, being a continued quay, faced with hewn stones, with stairs and jetties for the convenience of embarkation. On the north side of the port is a dock or harbor, appropriated exclusively for vessels performing quarantine. It is walled round; and is furnished with hotels, warehouses, and every sort of accommodation required for the use of passengers and goods. Ships under 300 tons burden lie close to the quays; those of greater size mooring a little farther out. The principal defects of the port are, its limited size, and its being exposed to the northwest winds, which sometimes blow with much violence, and throw in a heavy sea. The gales, however, are seldom of long continuance; and the holding ground being good, when the anchors are backed and proper precautions taken, no accident occurs. The tide at Trieste is scarcely perceptible; but the depth of water is influenced by the wind, being increased by a long-continued sirocco or southeast wind, and diminished by the prevalence of the east-northeast wind, known by the name of *Boro*. The access to the port is not obstructed by any bar or shallow; and there is good anchorage in the roads, in from 6 to 7 and 10 fathoms water. A good sailing vessel may beat in by night or by day, except it blow hard from the northeast or east-northeast, when she had better anchor in the Bay of Roses, or Pirano, where she will ride in perfect safety. Ships bound for Trieste are under no obligation to take pilots; but those entering the port for the first time would do well to take one on making the coast of Istria. Boats are always hovering off Rovigno; they are not manned by regular pilots, but by fishermen, who, though unfit to be trusted with the management of the ship, know the bearings of the places and the depth of water. The fee usually paid them for pilotage is twenty dollars; in addition to which, they are supported at the ship's expense during the performance of quarantine. The light-house at the extremity of the Theresian mole is 106 feet (Engl.) high. The light is intermittent; and may

be seen, supposing the eye of the observer to be elevated 12 feet above the level of the sea, about 12 nautical miles, or from Pirano on the side of Istria, and the shoals of Grado on the Italian coast. A light-house has also been erected on the point of Salvore, bearing from Trieste west by south, distant about 18 miles. The lantern is elevated about 103 feet above the level of the sea. From this point Pirano Bay opens, where vessels may anchor in safety in all sorts of weather.

Trieste has no command of internal navigation; but being the most convenient, or rather the only sea-port, not merely of the Illyrian provinces, but of the Duchy of Austria, and the greater part of Hungary, she possesses an extensive commerce. This has been increased by the facilities afforded to all sorts of mercantile transactions by the privilege of *porto franco* conferred on the town, and a considerable extent of contiguous country. Under this franchise, all goods, with but very few exceptions, may be imported into and exported from the city free of all duties whatever. Foreign products, when taken for consumption from Trieste into the interior, are subject to the payment of duties regulated by the interior tariff of Austria. These are very various, consisting partly of the raw and partly of the manufactured products of Austria Proper, Illyria, Dalmatia, Hungary, and Italy; with foreign articles imported and warehoused. Among the principal articles of raw produce may be specified corn, chiefly wheat and maize, with rice, wine, oil, shumac, tobacco, wax, etc.; silk, silk rags and waste, hemp, wool, flax, linen rags, hides, furs, skins, etc. The produce of the mines makes an important item, consisting of quicksilver, cinnabar, iron, lead, copper, brass, litharge, alum, vitriol, etc.; the forests of Carniola furnish timber, for ship-building and other purposes, of excellent quality and in great abundance, with staves, cork wood, box, hoops, etc.; marble also ranks under this head. Of manufactured articles, the most important are, thrown silk, silk stuffs, printed cottons from Austria and Switzerland, coarse and fine linens, and all sorts of leather. Under this head are also ranked soap, Venetian treacle, liquors, etc., with jewelry, tools and utensils of all sorts, glass-ware and mirrors, Venetian beads, refined sugar, and a host of other articles. Of foreign articles imported and reshipped, the most important are sugar, coffee, and dye-stuffs. Trieste is also a considerable depôt for all sorts of produce from the Black Sea, Turkey, and Egypt.

Customs Regulations.—The custom-house at Trieste has nothing whatever to do with the entry, reporting, etc., of vessels. When a ship arrives, she is reported to the health office; which publishes a list of arrivals and departures, with a statement of their cargoes, as they appear in the manifests. Ships are cleared by the same office, the masters being assisted by the consuls of the country to which they belong. As soon as a vessel has performed quarantine, she loads or unloads without any interference or inspection by the customs officers, or by any one else. Goods unsuceptible of contagion may be landed during quarantine. Being a free port, the bonding and warehousing system is, of course, unknown at Trieste.

Quarantine is strictly enforced at Trieste, and the establishments for facilitating its performance are complete and efficient. The Board of Health at this port is the central or principal one for the Austrian states; and maintains an active correspondence with all the principal ports, both in the Mediterranean and elsewhere. There are two lazarettos—that called St. Teresa, or Lazaretto *Nuovo*, is appropriated to vessels from the Levant and Egypt, which are, for the most part, subjected to the long or full quarantine of forty days. It is spacious, and properly guarded; having a sufficient number of military and medical officers and assistants; with extensive quays and magazines for housing and airing goods, dwelling-houses and apartments for resident officers and passengers, etc. It is, in fact, one of

the most perfect establishments of the kind in existence. The other, or old (*Vecchio*) lazaretto, contiguous to the great mole, is appropriated to ships and passengers performing a quarantine of not more than twenty-eight days; and, though inferior to the former, is sufficiently capacious and convenient. The sanitary offices, including that of harbor master, are near the centre of the port; where also are moored vessels under observation for a term not exceeding eight days. Here also are facilities for communicating *vicé voce* with persons under quarantine; and spacious warehouses, with adequate guards and other officers. But, notwithstanding these conveniences, if a vessel arrive having an infectious malady on board, she is not allowed to enter either lazaretto at Trieste, but is sent to an island near Venice, fitted out for the purpose, where assistance may be afforded with less risk of propagating infection.

Careening, Stores, etc.—Timber at Trieste is excellent, workmen good, and their wages moderate; so that it is a very favorable place for careening and repairing. Water is very good, but rather scarce; so that if a large supply be required, due notice must be given. Ships are served in regular rotation. Beef is very good, but rather high priced. Butter and cheese are dear; and fuel is excessively so. On the whole, therefore, Trieste can not be considered as a favorable place for the provisioning of a ship.

Banking.—There are no public banks at Trieste. The Bank of Vienna has an office here, but it is merely for the exchange of its notes for cash, or more frequently, of large notes for small ones. These notes, being guaranteed by government, are legal tender, and in general circulation, but no other company is allowed to issue notes to be used as a circulating medium. There is not, however, any deficiency of currency. Banking business is transacted by private companies, or by individuals, who are subject to certain regulations, and are obliged to lay before competent authority an attested statement of the capital embarked in their concerns. Their business principally consists in procuring bills of exchange from other places for the use of the merchants of Trieste, or in discounting (in which latter operation they have many private competitors), at the rate of from 4 to 6 per cent. per annum, according to the nature of the paper offered, and in proportion to the scarcity or abundance of cash.

The Austrian official returns of imports from the United States for Trieste alone, it is seen, exceed the returns for all the Austrian ports, as per United States Treasury Reports. More than three-fourths of the foreign commerce of Trieste is carried on along the shores of the Mediterranean. The remainder is distributed between England, the United States, Brazil, Mexico, the Antilles, Russia, and the Netherlands. The direct trade between the port of Trieste and the two Americas, the Indies, and China, has within a few years become more active, and the tonnage specially employed by this port in such direct trans-Atlantic commerce notably augmented, in consequence of the successful competition on the part of the states lying on the basin of the Mediterranean with Trieste for a portion of this trade.

The average annual value of the general commerce of Trieste during the preceding ten years was: Imports 140,000,000 francs; and exports 76,000,000 francs; a total of 216,000,000 francs.

The figures from 1839 to 1849 show an increase in imports of 70 per cent., and in exports of 8 per cent. The great difference between the increased values of total imports and exports is accounted for by the fact that but a small proportion of the produce or manufactures of Austria finds its way to foreign countries through the port of Trieste. Most of this kind of merchandise destined for the East, the United States, and South America, is forwarded by the lower Danube, by the Elbe, and by Hamburg and Bremen. Besides, this difference can not be regarded as an evidence that the

balance of trade is so heavily against Trieste, when it is considered that many millions of dollars are annually expended in the markets of this port by the 70,000 sailors, the 25,000 passengers conveyed by steamships, and the 10,000 vessels that yearly arrive there.

It is proposed, and not only with the sanction, but under the patronage of the Austrian government, to construct three first-class steamships to run regularly between New York and Trieste, touching at Corfu, Malta, Algiers, Cadiz, and Lisbon. Should this project prove successful (and the high character of its originators is a strong guarantee of its success), its effect upon the commercial and political relations of the United States must be very great. In opening new channels to the industry of the Old World, it will also increase the demand for the raw produce and manufactures of the United States. The advantages of this proposed steam communication between New York and Trieste will be greatly increased by the completion of about sixty miles of railroad between Trieste and Vienna. This, when completed (and the work is in active progress), will connect Trieste with all the principal cities of Europe, and make it the entrepôt of a large German trade. It already enjoys steam communication with the Levant, Constantinople, and Alexandria; and, when the proposed line to New York shall have been established, Trieste will become an extensive dépôt for the raw materials of the United States. During the four years ending with 1853, New York received direct from Trieste merchandise to the value of \$2,085,282, and exported direct to the same place goods of the value of \$1,550,575. The following summary exhibits the general foreign trade of Trieste in 1851 compared with that of 1850, and also the increase:

Years.	Imports.	Exports.	Total.	Imports from U. States.
	Francs.	Francs.	Francs.	Francs.
1851	225,337,000	94,451,000	319,788,000	14,588,000
1850	202,126,000	91,347,000	293,473,000	10,547,000
Increase 1851	23,211,000	3,104,000	26,315,000	4,041,000

The following table, translated and condensed from Austrian official documents, will present an interesting statement of the number of American vessels employed in the trade of Trieste from 1842 to 1851, inclusive:

Years.	Vessels.	Years.	Vessels.
1842	38	1847	45
1843	48	1848	42
1844	51	1849	50
1845	55	1850	25
1846	60	1851	31

During the same period, the largest number that entered (the Austrian flag excepted) was 3386 vessels, under the Greek flag; and the smallest, 28, under the Belgian flag. The relative importance of the flag of

each nation in the general foreign commerce of Trieste will be seen from the following condensed table:

NUMBER OF VESSELS, OF ALL NATIONS, WHICH ARRIVED AT THE PORT OF TRIESTE DURING TEN YEARS, ENDING WITH 1851, AND THE PROPORTION WHICH THE FLAG OF EACH BEARS TO THE WHOLE NUMBER.

Flags.	Number in ten Years.	Proportion to the whole.
Austrian	5,80	37.50 per cent.
Greek	3386	24.0 "
English	967	6.75 "
Sicilian, etc.	724	5.0 "
Ottoman	485	3.50 "
Ionian	448	3.25 "
United States	445	3.25 "
Swedish, etc.	370	2.50 "
Russian	259	2.50 "
Sardinian	286	2.0 "
French	252	1.75 "
Danish	226	1.25 "
Dutch	222	1.25 "
Papal States	212	1.25 "
Hanseatic	126	0.90 "
Spanish	117	0.80 "
Prussian	81	0.60 "
Others	186	1.25 "

COMMERCE OF TRIESTE IN 1856.—(VALUE IN FLORINS.)

	Imports.	Exports.
Austrian ports	29,341,302	47,727,508
Foreign ports	91,627,897	61,418,602
Total by sea	120,969,199	109,146,410
Total by land	32,802,000	24,551,722

We add a tabular statement of the commercial movement of that port during a period of ten years:

Years.	Ships.	Tonnage.
1846	16,782	985,514
1847	17,321	1,007,331
1848	17,812	926,815
1849	20,553	1,269,258
1850	21,124	1,323,796
1851	24,101	1,408,802
1852	27,931	1,556,652
1853	29,317	1,675,886
1854	26,556	1,730,911
1855	21,081	1,439,197

On comparing the average of the first three years of this period with the average of the last three years (973,220 against 1,631,663), the increase within so short a space is found to be in the proportion of 68 to 100. Marseilles is far from exhibiting the same rapidity of progress. The basis of the prosperity of Trieste, besides, is all the more solid, as it is owing to the increased intercourse both with purely Austrian and foreign ports. The national trade, for instance, from 1846 to 1848, amounted to 416,709 tons average per annum; from 1853 to 1855 it had increased to 854,753 tons average per year, or more than double. During the years 1850 and 1855, inclusive, the Austrian tonnage entered in and out at Trieste was 6,206,316; foreign, 2,981,928 tons. The trade with Greece, Egypt, the Levant, and Black Sea, had risen from 257,741 tons to 496,394 tons average per year during the same period.

COMMERCE OF TRIESTE AND VENICE FOR THE YEAR 1851.

Countries.	Trieste.				Venice.

The treaty of 1829, between the United States and Austria, establishes a perfect reciprocity of commercial intercourse between the two countries. Its principal stipulations are as follows:

There shall be, between the United States territories and those of Austria, a reciprocal liberty of commerce and navigation. All the ports, places, and rivers of the territories of either power, open to foreign commerce, shall be open to the inhabitants of each respectively. Austrian vessels arriving, either laden or in ballast, in the ports of the United States, and, reciprocally, vessels of the United States, either laden or in ballast, arriving in the ports of Austria, shall be treated, on their entrance, during their stay, and at their departure, upon the same footing as national vessels coming from the same place, with respect to the duties of tonnage, light-houses, pilotage, and port charges, of whatever kind or denomination, levied in the name or to the profit of the government, the local authorities, or of any private establishment whatever. All kinds of merchandise, and articles of commerce, either the produce of the soil or of the industry of either country, which may lawfully be imported into each respectively, shall be admitted on payment of the same duties and charges, of whatever kind or denomination, as are applicable if imported under the national flag. This equalization of import duties and other charges to apply to the vessels and cargoes of each country respectively, whether they clear directly from the ports of the country to which they belong, or from the ports of any other foreign country. The produce or manufacture of either country shall be admitted into the ports of the other on the same terms as the like articles, being the produce or manufacture of any other foreign country; and no prohibition shall be imposed on the importation or exportation of any article, the produce or manufacture of either country, to or from the ports of the other, which shall not equally extend to all other nations. The vessels of both powers, respectively, shall be admitted into the ports of either, on the same terms as national vessels, with the produce or manufacture of their own or of any other country. An exact reciprocity shall be observed in the ports of the territories of either power, in respect to the vessels of the other exporting or re-exporting merchandise or produce of any country not prohibited; and the same bounties and drawbacks shall be allowed, whether such exportation or re-exportation be made in vessels of the one party or of the other. The coasting trade is reserved by each power to its own vessels, respectively. All favors hereafter granted by either party, in respect of navigation or commerce, to any other nation, shall become common to the other party, freely, if it was freely granted to such other, or on similar terms if it were conditional. The consuls, vice-consuls, agents, and commissioners of each of the high contracting parties shall enjoy, in the ports of the other, the same privileges and powers as those of the most favored nation. The treaty to continue in force for ten years, with the usual twelve months' notice by either party desiring to terminate it after that time.

Tonnage Duties.—On the 24th January, 1851, the central maritime government of Austria issued public notice that from that date the tonnage duties in force at the port of Trieste should be extended to all ports throughout the empire open to commerce. These duties are regulated by orders dated 8th November, 1845, and are as follows:

National vessels, 50 tons, or under.....	per ton,	Fl. Kr. 0 2
National vessels, 100 tons.....	"	0 4
National vessels, over 100 tons.....	"	1 6
Foreign vessels, without regard to tonnage	"	1 0

A mercantile house in New York, long engaged in the direct trade between that port and Trieste, furnishes the following statement of charges on a vessel of 1000 tons burden, entering the latter port:

Cooperage, at 6 kreutzers per ton	Fl. Kr. 100 0
Pilotage, at 3 kreutzers per ton	50 0
Health department upon arrival and at departure	2 32
Marine institute.....	12 0
Light-house dues, 7 kreutzers per ton.....	116 40
Total expense on a vessel of 1000 tons	281 12

The florin equals 60 kreutzers=48½ cents; consequently, the whole expenses amount to \$136 37½. Whether vessels take freight for several parties, or a single house, the stevedores make the same charges for stowing away the goods. The following are their fees for principal merchandise, viz.: for cotton, 2 florins per ton; for wool, hemp, flax, oakum, and roots, 1 florin 30 kreutzers per ton. Goods of such weight as raisins (black and red), figs, olive-oil, steel, cream of tartar, argol, etc., 30 kreutzers per ton; rags, grain, sumach, laurel leaves, tobacco, yellow berries, and juniper berries, 1 florin per ton. Goods which are measured, 30 kreutzers per ton measurement. Other articles in the same proportion. In discharging vessels, the only expenses are the lighters, which are provided by the agents of the vessels, and which are paid for by the receivers of the goods, in accordance with a general tariff, which the proprietors of the lighters have fixed upon by general consent. The captains are obliged to put the goods on board the lighters at their own expense. For this purpose hands can at all times be procured at 1 florin 15 kreutzers to 1 florin 30 kreutzers per diem. (55 cents to 64 cents). Men-of-war, national as well as foreign, and vessels putting in from stress of weather, or other necessity (which must, however, be verified), and not transacting any operations of commerce, are admitted to entrance, and allowed to purchase fresh provisions and other necessities, and to take a pilot, exempt from tonnage duties. Tonnage of national vessels to be ascertained by their register; of foreign vessels, by Austrian measurement.

Sanitary Regulations.—These are numerous and complicated; such only are subjoined as relate to vessels coming from all ports of the Americas, including all the ports of the West Indies: 1. Vessels with clean bills of health to be admitted, with crew and passengers, immediately on arrival, to free pratique. 2. Vessels with suspicious bills of health, such as having touched on their passage at suspected places, to be subjected to ten days' quarantine at the lazaretto, for passengers, crews, and susceptible goods; and goods not susceptible, to 5 days. 3. Vessels with foul bills of health to be subjected to fifteen days' quarantine at the lazaretto, for passengers, crews, and susceptible goods; and goods not susceptible, 10 days. The quarantine charges are very moderate, being, for entry and departure, upon a ship of 100 tons and upward (exclusive of 72 cents per diem for wages and food to the gondolier), about \$4 32; quarantine dues upon goods, 6 kreutzers (a little more than 4½ cents) per 100 florins value (\$48 50); and upon susceptible goods, 4 kreutzers (3½ cents) per 1000 lbs. weight.

General Remarks.—The development of the maritime commerce of Austria dates back as far as 1815, or, rather, from that period down to 1830; during which it gradually attained, chiefly by the aid of steam navigation, a high state of prosperity. The great commercial activity of the empire is principally concentrated at the port of Trieste; Venice and Fiume, so far, at least, as it respects foreign trade, being but subsidiary to this vast entrepôt. Besides these, Austria possesses on the Adriatic, 25 ports of secondary rank, which claim importance chiefly from their extensive coasting trade. The principal of these are Chioggia, 15 miles south of Venice; Rovigno, in Istria; Zara, Spalato, and Ragusa, in Dalmatia. This city was founded about the middle of the 15th century, and once enjoyed an extensive trade. It still exports manufactures of silk, leather, rosoglio, anchovies, etc. It continued to be a republic under the successive protection of the Greeks, Venetians, and Turks, until 1806, when it was

erected by Napoleon into a duchy for Marshal Marmont. Trieste, Venice, and Fiume, with some small ports on the Croatian shore contiguous to Fiume, are free ports. Prior to the year 1850, all produce and merchandise of whatever description, transported from one part of the Austrian territories into another (the empire being divided by an internal customs line), were subject to duties of entrance and clearance, equally as if they had been imported from, or exported to, a foreign country. By an imperial patent, issued on the 7th June, 1850, this line was suppressed, and all duties, prohibitions, etc., previously existing, were abolished; some formalities being reserved in respect to certain articles of which the government retained the monopoly. In submitting to the emperor his *projet* for this reform, the minister of finance observed, that "the influence of such a measure, in consolidating the vast and widely-extended resources of the empire, in establishing its unity and augmenting its power, would more than counterbalance the inconsiderable reduction of \$1,699,110 which it would cause in the revenues of the empire."

This liberal measure was soon after followed by another, equally beneficial to the foreign commerce of Austria—namely, the new tariff that went into operation on 1st February, 1852. In the complicated details of this tariff, there were various changes favorable to American trade. The duty on cotton, although considerably reduced from former rates, was, prior to the adoption of this tariff, 80 $\frac{1}{2}$ cents per 125.5 lbs. The tariff of 1852 reduced it again 48 $\frac{1}{2}$ cents per 110 $\frac{1}{2}$ lbs. for one year, and the year following to about 4 cents per 110 $\frac{1}{2}$ lbs. Since this latter period—namely, January 1, 1854—the article has been made free. Still later modifications of the Austrian tariff have been made, but they do not apply to any of the United States staples of export. Previously, tobacco was a strict government monopoly; under the new tariff, individuals are allowed to enter it for their own use, at reduced rates. Manufactured, it paid before 1852, \$19.40 per 100 lbs.; under the new tariff, this was reduced to \$12.12 $\frac{1}{2}$ per 100 lbs. This duty has been retained in the new tariff of 1854, with an additional duty, however, of 1 florin per livre de Vienna (48 $\frac{1}{2}$ cents), on unmanufactured, and 2 florins 80 kreutzers per livre de Vienna (\$1.21 $\frac{1}{2}$), on manufactured. The duties were reduced also on rice, whale oil, and the products of the whale-fishery, wooden-ware, tools, implements, and machinery for agricultural and household purposes, India rubber fabrics, etc. During the first year of the operation of the tariff of 1852, cotton twists paid \$3.88 per 110 $\frac{1}{2}$ lbs.; the ensuing year this was reduced to \$3.39 $\frac{1}{2}$. The centner before 1852 was equivalent to 125.5 lbs.; but, in order to bring about a conformity to the centner of the German Customs Union, it was fixed that year at 110 $\frac{1}{2}$ lbs.; that being the weight of the Prussian zoll-centner. Several articles, when imported by sea, are admitted by the tariff of 1852 at rates still more moderate; for example, alum, in general rated at 72 $\frac{1}{2}$ cents per 110 $\frac{1}{2}$ lbs., pays only 8 $\frac{1}{2}$ cents when brought in by sea. As the United States stand on the footing of the most favored nation, by virtue of the treaty of 1829, the provisions of the tariff of 1852 have contributed considerably to the employment of United States shipping.

The commercial reform of 1852 was, in a great measure, the result, or rather one of the results, of the revolution of 1848. Immediately after tranquillity had been restored, the Baron de Bruck, then minister of commerce, was charged with an administrative commission to prepare a new tariff upon the following bases, adopted by the Council of Ministers: An assimilation, as nearly as can be, to the tariff of the German Customs Association; the substitution of specific for *ad valorem* duties; the adoption of the quintal of 110 $\frac{1}{2}$ lbs., as a basis of quantities. On imports: The abolition of prohibitions; adequate protection to na-

tional industry; a graduating scale of duties on manufactured articles, according to the amount of labor employed thereon; a reduction of all taxes on articles of first necessity, either for manufactures or consumption. On exports: Balance-duties (weighing-dues), and all necessary formalities as simple as possible; a substitution of protective duties for prohibitions; the abolition of all premiums or drawbacks, unless in certain specified cases. On the preceding bases, the tariff which has been in part considered was submitted to the council, and had been under consideration several months, when the treaty of a customs league between Prussia and Hanover permitting no further delay, it was submitted to the emperor, and signed on the 6th day of November, 1851, at the very time that a commercial congress, to be composed of delegates from the different German states, was summoned to meet at Vienna in January, 1852. The imperial patent, which designated the 1st February, 1852, as the day on which the new tariff should go into effect, contained several orders of a temporary character. One was an extra duty of 10 per cent. on the aggregate duties levied on certain merchandise before prohibited. The duty on raw cotton was modified, and other temporary provisions were made, which, so far as they concern American trade, have been already adverted to.

Indeed, the tariff itself was not designed to be permanent. It was tried only as an experiment, and, by limitation, was to expire at the end of October, 1854; the government being meanwhile precluded, on the one hand, from raising the duties on imports for manufacturing purposes, and on the other from reducing them on articles manufactured half or in whole. At the same time, the export duties on articles of the former class could not be reduced, nor could similar duties on those of the latter be raised. The imperial patent, moreover, contained one notable provision, viz.: the duration of the tariff was to depend on the contingency of a treaty of commerce (with Prussia) being effected before the period fixed for its termination. It would shed but little light upon the commercial relations of the United States with Austria to follow up, and recount in this work, the proceedings of the commercial congress assembled at Vienna during the winter of 1852, or to recapitulate the resolutions adopted by the delegates of the southern states before presenting themselves at Berlin. It will suffice to say, that on the 19th February, 1853, a treaty was effected between Austria and Prussia, which was acquiesced in by all the other states of the Zoll-Verein. This treaty, stipulating as it does for large and reciprocal commercial concessions between the two powers, as a fitting prelude to a general customs league between all the German states, necessarily led to a revision of the tariff of 1852. This resulted in the adoption of the tariff now in force; to understand which, however, it must be borne in mind that many of the articles enumerated in that portion of the tariff, though rated at different duties when coming from foreign countries, are free when imported by the frontiers of the German Association, or coming from the interior of the associated states.

These privileged articles are specifically defined in a supplemental appendix to the tariff, dated February 10, 1854, and prefaced in the following terms: "As the first result of the arrangement entered into at Berlin by the Executive Commission, conformably to the 23d article of the treaty of commerce and of customs of the 19th February, 1853, and for the purpose of correcting some erroneous impressions, public notice is given that the following are the true constructions and modifications of the tariff of the 5th December, 1852. Said constructions and modifications shall be carried into effect so soon as they are received at the different bureaux of customs." (Then follows the list of articles coming under the special provisions of the treaty.)

The causes that compelled the revision of the tariff

of 1852, as well as the adoption of the present tariff (of 1854), are set forth in an article which appeared in the official journal, published at Vienna, of the 15th December, 1853.

In reference to the treaty with Prussia, this article holds the following language: "Other considerations induced a revision of the tariff of 1852. The treaty with Prussia is the first step in reforming the commercial policy of the empire. From it must result, at no very distant day, an Austro-German Customs Union; and a general reduction in tariff duties is the most fitting prelude to so desirable an event. Besides, the commercial treaty of August 7, 1852, concluded with Parma and Modena, removes all obstacles to an Austro-Italian Customs Union; and thus the event referred to (an Austro-German Customs Union) would present a guarantee for the prosperity and peace of the continent. The changes and modifications which could contribute to this end should command our most serious consideration. These are principally such reductions in tariff duties as are demanded by the best interests of commerce—not, however, to an extent that

might in any way prove detrimental to the industrial resources of the empire. Succeeding, as it does, a restrictive system, in operation for more than half a century, the tariff of 1852 is still encumbered with onerous duties and oppressive restrictions, repugnant to a great association of states accustomed to the most liberal system of commercial policy. Besides, the augmented exports of 1852 and 1853 demonstrate the wise policy of a general reduction of tariff duties, and furnish incontestable evidence that such a measure will most effectually repair the evils of past commercial legislation." The preceding remarks contain a summary of the official *exposé* already referred to, and explain the motives that induced the general remodification of the Austrian tariff. The abolition of the government monopoly of tobacco would remove the most serious and the only remaining restriction on American commerce. The customs union with the Germanic states, so much desired by Austria, will accomplish this, if it should not be effected before that event shall happen.—*U. S. Com. Relations.* The following is an exhibit of the commerce of the U. S. with Austria for 37 years:

COMMERCE OF THE UNITED STATES WITH TRIESTE AND OTHER AUSTRIAN PORTS ON THE ADRIATIC, FROM OCTOBER 1, 1820, TO JULY 1, 1857.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Trinidad. Trinidad is separated from the main land of South America by the Gulf of Paria. It is about 90 miles long and 50 miles wide, with an estimated superficial area of 2020 square miles. Capital, Puerto d'España. Trinidad appears at a distance like an immense ridge of rocks along its whole north front; but on entering the Gulf of Paria, one of the most magnificent, variegated, richly luxuriant panoramas that nature ever formed is presented to the eye of the voyager. To the east the waves of the mighty Orinoco dispute for the empire of the ocean with contending billows, and the lofty mountains of Cumana rise from the horizon in stupendous majesty; and on the west appear the cape, headlands, mountains, hills, valleys,

and plains of Trinidad, enameled with eternal verdure. The fecundity of the soil, its gigantic vegetation, its beautiful rivers, enchanting slopes, forests of palms, groves of citrons, and hedges of spices and perfumes, its fine azure skies and elastic atmosphere, have each and all combined to crown the isle with the appellation of "The Indian Paradise." The island is evidently a section of the opposite continent; the same strata, the same rocks, fossils, etc., are common to both. Its formation is evidently volcanic, and in many parts volcanic action is still going on, as indicated by its mud volcanoes and other cognate developments. The precious metals are not found here, nor indeed are any others, except in small quantities. Coal is found about

five miles from the shore. But the most remarkable mineral phenomenon is the asphaltum, or pitch lake, which covers an area of half a league.

Staples as in the other islands. United States vessels also export heavy quantities of iron, brass, lead (old), and hides. The imports from the United States in 1853 were \$537,604, and exports to United States were \$31,483. American vessels in Port of Spain in 1853, 59; tonnage, 11,472. Imports from United States from 1st January to 30th June, 1853, \$308,716; imports from 1st July to 31st December, 1852, \$268,148.

Port Regulations.—Upon every ship or vessel of 50 tons and upward, for every registered ton, 36 cents. Upon every ship or vessel of 25 tons and upward, but under 50 tons, for every ton of registered tonnage, 30 cents; and upon every ship or vessel under 25 tons, for every registered ton, 6 cents. Lumber, staves, bricks, slates, shingles, coal, etc., are also subject to a small wharfage duty. Sugar, cocoa, coffee, rum, indigo, etc., are liable to an export duty in this island. Trinidad embraces an area of 1970 square miles, containing a population of 45,284.

Trinity House. The full title of this corporation is, "The Master, Wardens, and Assistants of the Guild, Fraternity, or Brotherhood of the most Glorious and Undivided Trinity, and of Saint Clement, in the Parish of Deptford, Stroud, in the County of Kent"—an institution to whose members is intrusted the management of some of the most important interests of the seamen and shipping of England. The earlier records, together with the house of the corporation, were destroyed by fire in 1714; so that the origin of the institution can only now be inferred from usage and the occasional mention of its purposes in documents of a former period. A similar society, for the like purposes, was afterward established at Hull, and also another at Newcastle-upon-Tyne in 1537; which three establishments, says Hakluyt, were in imitation of that founded by the Emperor Charles V. at Seville, in Spain; who, observing the numerous shipwrecks in the voyages to and from the West Indies, occasioned by the ignorance of seamen, established, at the *Casa de Contratacion*, lectures on navigation, and a pilot-major for the examination of other pilots and mariners; having also directed books to be published on that subject for the use of navigators. According to some authorities the incorporation was founded in the year 1515. It is probable that with Henry VII. originated the scheme, afterward carried into effect by his son, Henry VIII., of forming efficient Navy and Admiralty Boards, which then first became a separate branch of public service. During the reign of Henry VIII. the arsenals at Woolwich and Deptford were founded, and the Deptford yard establishment was subsequently placed under the direction of the Trinity House, who likewise surveyed the navy provisions and stores. The earliest official document relating to the Trinity House now extant is a charter of incorporation made by Henry VIII. in the sixth year of his reign. An exemplification of this charter was granted by George II., in the third year of his reign.

The revenue under the management of the Trinity House arises from the dues payable to the corporation on account of light-houses, buoyage and beaconage, and ballastage; and from the interest of money in the funds, and the rent of freehold property, amounting to about £166,000 annually. Hitherto by far the greater portion of this large revenue has been expended on pensions to poor disabled seamen, and on the maintenance of their widows, orphans, etc.; and it is admitted that it has been both judiciously and economically administered. It is henceforth, however, to form part of the "Mercantile Marine Fund." The act provides that payments now chargeable on the "fund" for pensions, etc., may be commuted. The expenses of light-houses, ballastage, and beaconage are also to be charged on the "fund," and the rates of toll are to be revised

and fixed by her majesty in council. The ballastage rates under the Trinity House, being a charge peculiar to the Thames, are to be made peculiarly applicable to services performed for the safety and convenience of the shipping frequenting that river.

Of this corporation Lord Palmerston lately remarked, at the annual dinner given by the board of managers, "There is, indeed, a unity of operation between the government that may have to administer the affairs of this country and this body; for it is the function of the Trinity Corporation to provide pilots for those thousands of keels that plow the waves that wash our shore; and, on the other hand, to erect those lights which warn navigators from dangers which they would otherwise have to encounter, and which point out to them the havens where safety is to be obtained."—See *article LIGHT-HOUSES.*

Tripang, or Sea Slug (*Biche de Mer*), a species of fish of the genus *Holothuria*, found chiefly on coral reefs in the Eastern seas, and highly esteemed in China, into which country it is imported in large quantities. It is an unseemly-looking substance, of a dirty brown color, hard, rigid, scarcely possessing any power of locomotion, or appearance of animation. Sometimes the slug is as much as two feet in length, and from seven to eight inches in circumference. A span in length, and two or three inches in girth, is, however, the ordinary size. The quality and value of the fish, however, do not by any means depend upon its size, but upon properties in it neither obvious to nor discernible by those who have not been long and extensively engaged in the trade. In shallow water the animal is taken out by the hand, but in deeper water it is sometimes speared. When taken, it is gutted, dried in the sun, and smoked over a wood fire; this being the only preparation it receives. The fishery is carried on from the western shores of New Guinea, and the southern shores of Australia, to Ceylon inclusive. Indeed, within the last few years it has been successfully prosecuted on the shores of the Mauritius. The whole produce goes to China. In the market of Macassar, the great staple of this fishery, not less than thirty varieties are distinguished, varying in price from five Spanish dollars a *picul* (133½ lbs.) to fourteen times that price, each variety being distinguished by well-known names. The quantity of tripang sent annually to China from Macassar is about 7000 piculs, or 8383 cwt.; the price usually varying from 8 dollars a picul to 110 and 115, according to quality.—CRAWFORD'S *Indian Archipelago*, vol. iii. p. 441. There is also a considerable export of tripang from Manilla to Canton. Besides tripang, *fish maws* and *sharks' fins* are exported to China from every maritime country of India.

Tripoli. This regency is the most advanced of all the Barbary states, in civilization. It possesses a vast sea-coast, extending 350 leagues, from Tunis to Egypt. With the exception of where the desert meets the sea, near Monkhar, the northern or maritime part of Tripoli, for a few miles from the coast, has the same fertility and productions as Morocco and Tunis. Its area is estimated at 100,000 square miles, with a population of 1,800,000. Its products are corn and fruits, in great variety and abundance; also cotton, silk, tobacco, saffron, madder, and castor-oil. In the interior, senna, dates, and galls are the principal staples. The exports consist of dates, olives, straw mats, earthen-ware, and other domestic manufactures, partly exported by sea, and partly disposed of in barter to Bedouin traders. The other manufactures of Tripoli are carpets, thick cloaks, camlets, goats'-hair sacking, prepared skins, Morocco leather, and potash. These, together with the produce of Central Africa, which annually arrives in caravans, are exchanged for European and colonial goods. The principal trade of Tripoli is with Malta, Tunis, and the Levant. The sea-ports are Tripoli, Bengazi, and Dernah, with several others of little or no importance.

The navigation and commerce of the two principal ports, for a series of years, are thus given by French authorities: In 1846 there entered, Turkish vessels, 108; Greek, 35; Tuscan, 14; Maltese, 14; French, 14; Russian, 4; English, 3; Sardinian, 1; Austrian and Sicilian, each, 1. Total, 195 vessels; of which 167 were laden with merchandise valued at 1,872,000 francs. During the same year there cleared—Turkish vessels, 78; Greek, 25; Tuscan, 15; Maltese, 18; French, 14; English, 3; Russian, 2; Sardinian, 2; Austrian and Sicilian, each, 1. Total, 159 vessels; of which 121 were laden with produce valued at 983,000 francs. In the port of Bengazi there entered the same year 142 vessels, of which 113 were laden. Provisions (chiefly barley) and tobacco are extensively and profitably imported into Tripoli. This trade is chiefly monopolized by the Turks, Greeks, and Russians. The vessels of these countries trade with the ports of the Levant, carrying to those places cargoes of salt taken on board at Zoara.

COMMERCIAL MOVEMENTS OF THE REGENCY OF TRIPOLI IN 1851 AND 1854.

	1851.	1854.
Imports	francs 2,995,000	2,217,000
Exports	" 5,817,000	5,524,000
Total	" 8,812,000	5,821,000

Navigation returns for this port in 1851 are condensed as follows:

Entered	204 vessels	18,360 tons.
Cleared	191 "	16,879 "

FOREIGN TRADE OF TRIPOLI IN 1852 AND 1853.

Countries.	Imports.		Exports.	
	1852.	1853.	1852.	1853.

Austria	150,114	799,500	4,000	5,000

The duty exacted in the Tripolitan ports is four piastres per 80 kilograms—equal to about eight cents per ton. Pilots are not often employed; when required, the captain of the port must furnish them free of expense. Quarantine regulations the same as at Constantinople. Notwithstanding Tripoli is tributary to the Ottoman empire, there is a separate treaty between the United States and that regency, ratified June 4, 1805, placing the commerce between the two countries on the footing of the most favored nation.—*Com. Rel. U. S.*

Treaties.—By the treaty concluded with Tripoli June 4, 1805, it is stipulated that the consuls and agents of both nations, respectively, shall have liberty to exercise their religion in their own houses; and those of the same religion shall not be impeded in going to the consul's house at the hour of prayer. The consuls shall have liberty and personal security given them to travel within the territories of each other both by land and sea, and shall not be prevented from going on board any vessel that they may think proper to visit. They shall have, likewise, the liberty to appoint their own dragomans and brokers. In case of any dispute arising between the contracting parties, no appeal shall be made to arms, nor shall war be declared under any pretext whatever; but if the consul residing at the place where the dispute shall happen shall not be able to settle the same, the government of the country shall state its grievances in writing, and transmit it to the other; and the period of twelve calendar months shall be allowed for answers to be returned, during which time no act of hostility shall be permitted by either party; and in case the grievances are not redressed, and a war should be the event, the consuls and citizens or subjects of both parties, respectively, shall be permitted to embark, with their effects, unmolested, on

board of what vessel or vessels they shall think proper. If any disputes shall arise between citizens of the United States, or any persons under their protection, such disputes shall be settled by the consul of the United States in the same manner as stated above, in Morocco. The same provision is made in the treaty with Tripoli, in respect of homicides, as in the treaty with Morocco. The care of the property of citizens of the United States dying in the regency of Tripoli is to be committed to the care of the consul, unless otherwise disposed of by will; and no hindrance is to be interposed to the execution of any will that may appear.

"The commercial intercourse of the United States within this consular district is dependent solely on the regulations of the mother country. These regulations are set forth in the tariff settled between Turkey and Great Britain on the 31st of October, 1850, and which applies also to the United States, under that clause of our treaty with Turkey which secures to us all the privileges of "the most favored nations." The commerce of the United States with this regency stands on the same footing as that of the most favored nations. It enjoys no exclusive privileges nor suffers any peculiar restrictions. There is only a port charge of about three cents the ton, which is levied equally on foreign and national vessels.

"The true par or intrinsic value of the piastre of this country is 12½ sous, French; but we reckon it at 12½ cents. The present bey has, however, issued a gold currency, composed of pieces of 100, 80, 40, 20, and 10 piastres each, which are about 20 per cent. deficient in weight; and, consequently, in gold money the piastre is worth only ten cents. The Christian population refuse to accept this new gold currency at its nominal value, but the arbitrary power of the bey compels its circulation among his own people, and prices have advanced nominally already since its appearance, without other apparent cause. Whether absolute power can effect the magical work of maintaining in free circulation two currencies of the same denominations and names, but of different intrinsic values, remains to be seen.

"The duties on exports to the United States, as to all other countries, are, on oil, 2½ piastres the metal, which is about 5-08 gallons, United States liquid measure. Thus we have 6½ cents per gallon. This oil is olive-oil, and is of a quality highly esteemed in Europe. The exportation of horses and camels is prohibited, and only allowed as a special favor to individuals or governments. The exportation of grain is generally confined to the bey himself, who consequently makes his own price. A very large portion of the oil is also exported by the bey. The import duties on goods of the United States are established at 3 per cent. *ad valorem* by treaty. The internal taxes on the products of the soil are levied at 10 per cent., but the management of assessors, by assessing the crop in its growing state, frequently causes the actual tax to exceed this rate. Besides, there are octroi duties, more or less heavy, on all articles of produce sold in the cities for consumption."—*Com. Rel. U. S.* See TREATIES, COMMERCIAL.

Tron Weight, the most ancient of the weights used in Scotland; and though its use is now prohibited by law, it is still occasionally employed in some of the rural districts in weighing wool, cheese, butter, etc. The tron pound was not a well-defined weight, but varied from twenty-one to twenty-eight ounces avoirdupois.

Trough of the Sea, in *Marine language*, the surface of water between two waves.

Troy Weight, one of the most ancient of the different kinds used in Britain. The pound English Troy contains twelve ounces, or 5760 grains. It is used in the weighing of gold, silver, and jewels; the compounding of medicines; in experiments in natural philosophy; in comparing different weights with each other.

er; and is now made the general standard of English weight in Great Britain and in the United States.

Before the American Association for the Advancement of Science in 1857, J. B. Gibbon, Esq., Assayer of the Mint of North Carolina, read a paper on the rise and gradual discontinuance of Troy weight in coinage and commerce. He stated that about 1900 years ago, or about fifty-two years before the Christian era, Julius Cæsar had described the inhabitants of Great Britain and Gaul as making use of brass and iron rings, by weight, for money. Gold-ring money of the Celts was also annually dug up in Ireland; and similar money was employed by the Scandinavians, on the shores of the Baltic. They were multiples of one certain ounce, or integers of its proportions—the word for ounce being claimed as a purely Celtic one. Recently an ambassador wrote from Antwerp that he had purchased a gold chain of Rubens with the links stamped by the goldsmiths of the day to mark their weight and fineness. In South Africa, at the present day, there was a similar employment of metal rings; and a civilized country of antiquity, as appeared from paintings still remaining on walls, employed rings which were carried to Cush or Ethiopia. Another nation had pieces of coin stamped with the likenesses of idols for the same purpose. The old pound of the Anglo-Saxons was called *Easterling*, from which came the modern sterling. In France there was a pound called the pound of Rochelle, and the Germans named it the pound of Cologne. A new system, by which the pound of silver in tale was also made the pound in gross, was arranged by Charlemagne in the 8th century. In England, under William the Conqueror, it was decreed that measures, weights, etc., should remain as they had been under his predecessors. In 1256, by consent of the whole realm, it was determined that the silver penny, called *Easterling*, should be round, and that it should be of the weight taken from the middle of the ear. Twenty of these penny-weights were to make an ounce, twenty ounces one pound; eight pounds of silver a gallon of wine; and eight gallons of wine a bushel, the eighth part of a quarter. Troy weight was supposed to have been derived from the Eastern nations, and transmitted first to Troyes, in France, from Cairo, during the crusades. From Troyes it was carried into England by the goldsmiths, and found favor there under Henry VIII., who began to debase the standard fineness of silver coins and to reduce their weight. Before this a statute established a common standard by which silver and wheat were assumed to be the natural tests, the one of the other. Unfortunately, neither was exactly suited for the purpose. It had been found by experiment with white and red wheat, forty to forty-three grains were required to balance a grain of silver, and from twenty-eight to thirty-five or thirty-six grains of white wheat effected the same thing. In short, grains were not intended to serve as a just measure for perfect comparison, multiplication, or division.

Acting upon the opinion that the laws of physical nature operate uniformly, and that the heavenly bodies are governed by fixed rules alike applicable to all matter, while Sir Isaac Newton was Master of the Mint, in the reign of George I., the vibration of a pendulum in the latitude of London, on a level with the sea, was measured, and the length made to serve as the standard of the imperial yard of Great Britain. Weights have been based upon a standard arising from a quantity of distilled water at a certain temperature, and having a certain cubic content. Upon the advice of the House of Commons, and afterward of a committee of the Royal Society, addressed to the Prince Regent, it was determined, under George IV., that the standard made by Bird in 1760 should be the legal standard of length in Great Britain; that the pound Troy should be still continued; and that 7000 grains should be the pound *avoirdupois* in the British empire.

By act of Congress in 1828 it was determined that the Troy pound procured by the minister in London in 1827 should be the standard, in the United States, to regulate the coinage. Yet there were three standards still in use in the United States coinage—the standard for quantities from Great Britain, the standard for purity from France, and the standard for proportion from Spain.

In the United States system many changes had been effected in the system in force at the Mint. The Troy ounce was divided decimally, and the other proportions were discarded. The French *gramme* used for silver, and the half *gramme* used for gold, with their thousandth parts, had replaced the old carat grains; and the proportion was based upon the dollar—a credited but erroneous ounce of silver, the sixteenth part of a pound *avoirdupois*, divided decimally for account. The act of 1772, which established the United States Mint, was founded on the report of the first Secretary; and notwithstanding many changes in the United States, the system there was still subject to the same objections as that of England, being copied from erroneous models, and not founded with scientific accuracy on systematic, uniform, and intelligible views, such as are required for the purposes of coinage, of commerce, of the arts and professions of life, as well in Great Britain as for her colonies, and by the United States.—*See WEIGHTS.*

Truck System, or Store Account, a name given to a practice that has prevailed, particularly in the mining and manufacturing districts, of paying the wages of workmen in goods instead of money. The plan has been for the masters to establish warehouses or shops; and the workmen in their employment have either got their wages accounted for to them by supplies of goods from such *depôts*, without receiving any money, or they have got the money, with a tacit or express understanding that they were to resort to the warehouses or shops of their master for such articles as they were furnished with.

Truffles, a sort of vegetable production, like a mushroom, formed under ground. A few have been found in Northamptonshire; they are pretty abundant in Italy, the south of France, and several other countries. They are reckoned a great delicacy. The *pâtés au truffes d'Angoulême* are highly esteemed, and are sent as presents to very distant places.—*REES' Cyclopædia.*

Trust and Trustee. A trustee is he who undertakes to discharge a trust, and a *cestui qui trust* is the person who is entitled to the benefit of a trust. A *trust*, which is, in fact, a new name given to a use, is defined by Lord Coke to be "a confidence reposed in some other, not issuing out of the land, but as a thing collateral, annexed in privity to the estate of the land, and to the person touching the land, for which *cestui que use* has no remedy but by subpoena in Chancery."

Tschaik (*Turkish ship*), is a light galley used on the Danube, and provided with a sail and rudder. The *tschaik* generally carries from two to twelve guns, and from ten to one hundred men.

Tulips. They came to England from Vienna, A.D. 1578, and have always been among our most esteemed flowers. They became an object of commerce in the 16th century; and it is recorded in the register of the city of Alcmæer, in Holland, that in the year 1639, 120 tulips, with the offsets, sold for 90,000 florins; and in particular, that one of them, called the *viceroi*, sold for 4203 guilders! The states at last put a stop to this extravagant and ruinous passion for flowers. The tulip-tree (*Liriodendron tulipifera*) was carried to England from America, about 1663.—*HAYDN.*

Tulip-tree (*Liriodendron tulipifera*), one of the most remarkable of our North American forest trees. In most parts of the United States the tree is known under the name of poplar-tree. The wood is of a light color, with a greater specific gravity than white pine, and is found in most of the States and Territories. The

qualities are a moderate resistance to decay, and easy manipulation. The principal defect is the liability to shrink and warp. The wood is in common use, on account of its abundance and cheapness, for the manufacture of common furniture, shingles, and dry lumber.

Tunis. The state of Tunis possesses nearly the same natural advantages of soil and climate as Morocco. In ancient times it was one of the granaries of Rome, supplying wheat, maize, barley, olives, grapes, dates, and other fruits. Tobacco, cotton, and indigo have recently been introduced as articles of culture, and small quantities of saffron and opium are also raised. The principal manufactures of Tunis are of red caps, exported to all parts of the Mediterranean; of soap, at Susa chiefly; and of woolen, silk, and linen fabrics, and morocco leather. The chief imports by sea are cochineal, raw silk, coffee, sugar, Spanish wool (to make *tarbouches*, or red caps), wines, specie, etc. Caravans arrive annually from Central Africa, bringing slaves, senna, ostrich feathers, gold dust, gum, and ivory, which are bartered for manufactured goods, spices, and gunpowder; while others, from Constantinople, bring wax, dried skins, cattle, and sheep, in return for muslins and other woven fabrics, Tunis mantles, colonial produce, essences, etc.

There are no official or reliable data from which the value of the general foreign export trade of Tunis can at the present time be gathered. The following statement of the average annual exports is based upon an estimate made by the French consul, and found in *MACGREGOR'S Commercial Regulations*:

	Francs.
Olive-oil	4,000,000
Wool	1,500,000
Red caps (<i>tarbouches</i>)	1,800,000
Other woollens	509,000
Wheat and pulse	280,000
Nuts, dates, etc.	90,000
Cattle	100,000
Sponges	200,000
Wax	40,000
Hides	280,000
Senna	50,000
Soap	60,000
Elephants' teeth and gold dust	400,000

Total average of exports 9,259,000 francs, or nearly \$2,000,000. The principal port is Tunis, situated on a salt lake, communicating with the sea by a canal or strait. Large ships anchor in the road or bay. The other chief ports are Biserta, Farina, Hammamet, Sfax, and Gerbis. The commercial relations between the United States and Tunis are regulated by treaty of February 24, 1824.—*See TREATIES, COMMERCIAL.* No official data are at hand upon which to base an estimate of the character or value of the trade between the United States and this regency. There is no direct trade, it is believed, between the United States and Tunis, commercial movements passing mainly by way of Malta and Marseilles. Macgregor gives a statement of the imports into and exports from Tunis in 1839, of which the following is a summary:

Imports	8,089,000 piastres = 25 cents each.
Exports	5,376,000 "
Total	13,465,000 " = \$3,366,250

In this total the United States figured for:

Imports from Tunis	238,000 piastres.
Exports to Tunis	268,000 "
Total	506,000 " = \$126,500

In 1842 there entered 341 vessels, with an aggregate of 33,321 tons; and there cleared 331 vessels, measuring an aggregate of 33,425 tons. The trade is conducted chiefly under the British, Maltese, French, Neapolitan, Sardinian, Tunisian, and Austrian flags. These import wine, spirits, iron, sugar, coffee, cotton, beans, and manufactured goods; and carry back wool, hides, wax, barilla, sponge, oil, almonds, salted fish, nuts, bones, dates, corn and meal, wax, soap, tissues of wool, etc., and leeches.

* The present value of the piastre is about 12½ cents.

The authority cited gives the navigation duties in the different ports of Tunis as follows:

Duties.	Tunis.	Susa-Monastier.	Sfax and Gerbis.
Anchorage duties ..	\$2 62½	\$1 06½	\$1 06½
Captain of port tax ..	25	25	31½
Water tax	1 25	12½
Odabushi tax	65
Total	\$4 52½	\$1 43½	\$1 38½

Besides these fixed charges, there are also incidental expenses peculiar to Tunis, viz.: 1st. All vessels which enter the Goletta Canal for repairs, or for any other purpose, pay an entrance and departure duty of \$5, and \$1 25 besides, daily, if the vessel is above 50 tons; 2d. A vessel taking in ballast from the land is taxed \$375; 3d. On every vessel which finds itself unsafe in the roadstead, on account of the bad quality of its cable, or from any other reason, and wishes to get under the shelter of the mole of the Goletta, a duty of 12 caroubes (18½ cents) per ton is imposed so long as it remains there, renewable every six months. Besides this duty, the captain of the port receives 75 cents. In addition to the foregoing, the following information is condensed from official returns communicated to this Department: The total port charges on entering the Goletta (the harbor of Tunis) amount to \$6 50 for lights, anchorage, health officer, etc., for vessels of over 30 tons; under 30 tons, one half that charge. These charges apply alike to all vessels, either Tunisian or foreign.

Export duties—inconsiderable, however—are levied upon oil, wool, and soap.

The import duties on goods and merchandise are regulated by treaty, and amount to 3 per cent. The articles from the United States which usually find a good market in Tunis are rum, tobacco, small freights of flour, cheap cotton fabrics, provisions, cheese, salt beef, dried beef, hams, pickles, and biscuit; but it would not be advisable to risk large cargoes of these articles. The coasting trade is permitted to all foreign vessels, without paying any other duty than those named in the tariff. The quarantine regulations are: Quarantine of observation, fixed at 10 days, is only required 7 or 8 days, though the vessel pays for 10; and when coming from any port in the Mediterranean, she pays \$1 25 per day. Besides this tax others are levied, amounting in the whole to \$25 62½. On vessels from the Levant, these taxes, according to Macgregor, are levied for 20 days, and amount to 202 p. 8 c. (\$50 52). These are the rates at the port of Tunis. At the other ports the quarantine of observation is usually 10 days; expenses nearly the same.—*Comp. Rel. U. S.*

With the exception of certain privileges granted to Great Britain and Spain, no privileges permitted to the commerce of foreign nations are denied to the United States. By treaty, Great Britain obtained the privilege of exporting annually for the support of the garrison of Gibraltar, on payment of a duty of \$5 per ox (though the fixed duty is \$10), 2000 oxen. Spain, when formidable, obtained by treaty the following privileges, viz.: the exportation of oxen on paying a duty of \$3 per ox, instead of \$10; fowls at 15 cents per dozen instead of \$1; pulse at 30 cents per 1½ bushel instead of 90 cents; and a proportionate reduction on all other eatables. These privileges, however, are at present disregarded. No restrictions are imposed on the commerce of other nations nor on that of the United States.

The port charges and dues levied on vessels of the United States are simply the anchorage dues, which are exacted according to the tonnage of the vessel. The U. S. Consul says, "I am led to think that the restrictions which obstruct a direct trade with the United States are the high duties levied in the United States on produce in general of this country. If such duties were reduced to a trifling amount, as they are in Great Britain, a powerful and salutary influence would be the result. Take, for example, the coarse wool of this

country, which enters so largely into our manufactures. Remove entirely, when imported from Morocco in American bottoms, the duty from this one article, and that direct trade which twenty-four years ago existed will again spring up. The great market for the wool of Morocco is even now the United States; but our ship-owners derive no benefit from the demand. It finds its way to the United States through Marseilles and Gibraltar, and French and English vessels make a monopoly of the carrying trade. If, with the extra expenses of transshipment, the additional transportation, the extra commissions, insurance, etc., our manufacturers now find it to their interest to purchase largely of the wool of this country, how much greater will be the demand, and consequently the employment, of American vessels, if a direct trade between the United States and Morocco is brought about? It is true, the export duties of this country are liable to sudden fluctuations; but contracts for certain periods can be made with the sultan, which exempt the contracting parties from being affected by those fluctuations."—*Consular Returns U. S. 1854-'55.*

Tunis, the capital of the regency of the same name, on the northern coast of Africa, the Goletta fort being in lat. $36^{\circ} 48' 30''$ N., long. $10^{\circ} 25' 46''$ E. The Bay of Tunis is somewhat in the form of a horseshoe. Its western extremity, Cape Carthage, is situated about four miles northeast from the Goletta; and its eastern extremity, Cape Zafran, bears from Cape Carthage east by south, distant about 13 miles. The bay is about 16 miles deep, and has good anchorage all over, in from 10 to 4 fathoms water. It is exposed to the north and northeast gales; but they seldom occasion any damage. Tunis lies on the west side of the bay, being separated from it by a large lagoon, having, where deepest, about 7 feet water. The port is at the Goletta, or channel, passing through the narrow belt of land separating the lagoon from the sea; the entrance to it is by a canal, in which there is at all times 15 feet water; and ships may use it on paying a fee of three dollars a day. It is not, however, much resorted to—all vessels of considerable burden loading and unloading from their moorings in the bay by means of lighters. The population of Tunis has been variously estimated; and may probably amount to 100,000, being the most populous of any African city after Cairo. The streets are narrow, unpaved, and filthy. The buildings, though of stone, are mean and poor; and the inhabitants present the picture of poverty and oppression. There is a fort at the Goletta of considerable strength.

Trade.—Notwithstanding the various drawbacks arising out of the nature of the government, and the ignorance and prejudices of the people, commerce and industry are in a more advanced state in Tunis than in any other part of Northern Africa, Egypt excepted. Though subject to droughts, the climate is, on the whole, excellent. The soil still preserves that exuberant fertility for which it was famous in antiquity.

Non quicquid Libycis terit
Fervens arca messibus.—(SENEC. in *Thyest.*)

It seldom receives any other manure than that of sometimes burning the weeds and stubble; and yet, in despite of its slovenly culture, the crops are luxuriant; and there is generally a considerable excess of wheat and barley for exportation. Corn is principally shipped at the Biserta, about 50 miles west of Tunis. Olive-oil is one of the principal articles of export. It is of various qualities; some good, and some very indifferent. Susa is said to be the best place for its shipment. Soap of an excellent quality is largely manufactured in the regency. It may be had either soft or in wedges. The soft is made of barilla and pure oil, and is much esteemed. The hard soap is made from the lees of oil, and is reckoned very strong. The principal soap-works are at Susa. Little, however, is prepared on a speculative anticipation of a demand for exportation; but any quantity may be had by contracting for it a few

months before the period when it is wanted. A sort of woolen skull-caps are largely exported. They are in extensive demand all over the Levant, and are nowhere made in such perfection as here. Ivory and gold dust, hides, wax, morocco leather, sponge, barilla, coral, dates, ostrich feathers, etc., are among the articles of export. The imports from Europe consist of woollens, coarse German and Irish linens, cotton stuffs, hardware, sugar, coffee, spices, tin plates, lead, alum, dye-stuffs, wine, silk, Spanish wool, etc. There is very little direct trade between Tunis and England; but a good deal is indirectly carried on, through the intervention of Malta and Gibraltar. Marseilles has probably the largest share of the trade with the regency. In 1880 there entered the different ports of Tunis 194 ships, of the burden of 20,747 tons, exclusive of those engaged in the trade with the other African states and Turkey. Exclusive of the trade by sea, a considerable trade is carried on between Tunis and the interior of Africa, by means of caravans. These import slaves, gold dust, ivory, feathers, drugs, etc. They carry back cotton stuffs, linens, hardware, spices, cochineal, etc. Naval and military stores imported into Tunis pay no duty. Other articles pay a duty of 3 per cent. *ad valorem* on a rated tariff. Obstructions arising out of monopolies, etc., are occasionally thrown in the way of exportation; and in general it is necessary, before proceeding to ship, to obtain a *tiskery*, or license to that effect, from the bey. That, however, may be, for the most part, procured without much difficulty.

Tunnels. The earliest tunnel for the purpose of internal navigation was executed by M. Riguet, in the reign of Louis XIV., at Beziers, in France. The first in England was by Mr. Brindley, in the Duke of Bridgewater's navigation, near Manchester, about 1760. Era of the Gravesend Tunnel, 1800—the report upon it, 1801. The Thames Tunnel projected by Mr. Brunel in 1823. This last wonderful undertaking was completed and opened for foot passengers March 25, 1843.—HAYDN. See *Thames Tunnel*. The principal railroad tunnels in the United States are: 1. On the Dayton Railroad, at Cincinnati, 10,080 feet in length. 2. Kingwood Tunnel, on the Baltimore and Ohio Railroad, 5000 feet. 3. Blue Ridge Tunnel, on the Virginia Central Railroad, about 5000 feet. 4. The Hoosac Tunnel, through a granite formation, western portion of Massachusetts (now in progress). 5. On the Kentucky Central Railroad, between Cincinnati and Lexington, about 3500 feet. 6. The Bergen Tunnel, on the New York and Erie Railroad, near Jersey City, about 5000 feet (now in progress).

Thames Tunnel.—Projected by Mr. Brunel, to form a communication between the two sides of the river, at Rotherhithe and Wapping, the most extraordinary construction of ancient or modern times. The shaft was begun in 1825. At a distance of 544 feet from the shaft the first irruption took place, May 18, 1827. The second irruption, by which six workmen perished, January 12, 1828. The length of the tunnel is 1300 feet; its width is 35 feet; height 20 feet; clear width of each archway, including foot-path, about 14 feet; thickness of earth beneath the crown of the tunnel and the bed of the river, about 15 feet. The tunnel was opened throughout for foot passengers March 25, 1843.

Turban, the head-dress of many of the Eastern nations, consisting of two parts, a cap and a sash, the latter artfully wreathed about the head. The sash of the Turk's turban is white linen; that of the Persians, red woolen. These are the distinguishing marks of their different religions. Lophi, King of Persia, being of the sect of Ali, was the first who assumed the red color, to distinguish himself from the Turks, who are of the sect of Omar.—HAYDN.

Turbith, or **Turpeth**, the cortical part of the root of a species of *Convolvulus*, brought from different parts of the East Indies. It is a longish root about the thickness of the finger, resinous, heavy, of a brownish hue

without and whitish within. It is imported cloven in the middle, lengthwise, and the heart or woody matter taken out. The best is ponderous, not wrinkled, easy to break, and discovers to the eye a large quantity of resinous matter. At first it makes an impression of sweetness on the taste; but, when chewed for some time, betrays a nauseous acrimony. It is used in medicine, but only to a small extent.—*Lewis's Mat. Medica*.

Turbith (mineral), the name given by chemists to the sub-sulphate of mercury.

Turbot (*Pleuronectes maximus*), a well-known and highly esteemed species of fish. Considerable quantities of turbot are now taken on various parts of the coasts of Great Britain, from the Orkneys to the Land's End, yet a preference is given in the London markets to those caught by the Dutch. The latter are said to have sometimes drawn as much as £80,000 in a single year for turbots sold in London.

Turkey. The countries included under the above general designation of Turkey, the Levant, etc., are Turkey (European and Asiatic), the pachalic or vice-royalty of Egypt, the kingdom of Greece, and the republic of the Ionian Islands—a group in the Mediterranean, off the west coast of Greece and Epirus, consisting of seven principal and several smaller islands.

The Ottoman empire includes Turkey in Europe, Asia Minor, Syria, Egypt, and the other tributary states in Africa and Asia. Prior to the Greek revolution, Turkey in Europe possessed an extensive maritime frontier (nearly two-thirds of her boundary), having many excellent sea-ports. The dismemberment of Greece, and other subsequent political changes, and the cession of Bessarabia and a part of Moldavia to Russia, have considerably reduced the limits of the dominions of Turkey in Europe. In Africa her power is almost annihilated, and even in Asia her authority is considerably weakened. Algeria has been wrested from her by France; Egypt merely acknowledges her sovereignty by the payment of an annual tribute; and the Arabians scarcely recognize the sultan as the head of their religion. The limits and area of the Turkish empire are not exactly defined, and, consequently, very different estimates have been formed of the extent and population both of European and Asiatic Turkey. The most recent authority estimates the area of Turkey in Europe at 210,000 square miles, and its population at about 15,000,000; and that of Turkey in Asia at 437,000 square miles, with a population of about 16,000,000. Turkey in Europe possesses a soil remarkably fertile, and a climate highly favorable to the production of the vine, olive, maize, wheat, and rice, vegetables of every description, fruits, tobacco, hemp, flax, the mulberry, various trees from which the most valuable gums are extracted; and in the southern part the sugar-cane and the cotton-tree. To these add the rich pasturages for horses, cattle, and sheep, every variety of game and fish, with a great abundance of mineral riches, together with the geographical position and excellent harbors of European Turkey, and a general idea may be formed of her great natural resources. The principal species of grain cultivated in European Turkey is Indian corn. Rice is cultivated along the banks of the Maritza and other marshy tracts in the southern provinces, but not in sufficient quantities for consumption. The deficiency is supplied by Egypt and Asia Minor.

Turkey in Asia possesses almost every natural element of industrial and commercial greatness; but agriculture is wholly neglected, and productive industry is altogether unknown.

About nine-tenths of the extensive surface of Egypt is sterile and unproductive. The remaining one-tenth, being irrigated by the overflowings of the Nile, yields the richest and most luxuriant crops, which, with the various commodities that pass through Egypt from Arabia, India, and Nubia, form the elements of a large

export trade. The crops of Egypt are wheat, Indian corn, maize, rice, flax, hemp, clover, cotton, indigo, sugar-cane, tobacco, oranges, and the most delicious fruits.

The sea-ports of Turkey in Europe are as follows: Constantinople, one of the safest ports in the world, and capable of affording shelter to 1200 of the largest class ships; Salonica, at the bottom of the gulf of that name, an excellent roadstead, and much frequented; and Enos, the port of Adrianople, on the Maritza. Gallipoli and Rodosto, on the Sea of Marmora; Varna, on the Black Sea; and Ibrahimlow, Taultcha, Galatz, and Jassaktschi, on the Danube, are ports of considerable commercial activity.

On the island of Candia there are two ports, Candia and Canea, but their harbors are neither commodious nor safe. Besides these, there are several other ports, which afford excellent shelter, and in the possession of a more industrious and commercial people than the Turks would attract considerable trade.

The sea-ports of Turkey in Asia are Ereklî; Scutari, opposite Constantinople; some indifferent ports on the Sea of Marmora; and Smyrna, the principal port of Asia Minor, and the most important in foreign commerce.

In Egypt the sea-ports are Alexandria, Rosetta, Damietta, and Cairo, at the mouths of the Nile; and Suez and Kosseir, on the Red Sea.

The principal exports of Turkey are wool, goats' hair, cattle, horses, hides, hare-skins, wheat, raw cotton and silk, tobacco, raisins, figs, almonds, mastic and other gums, gall-nuts, vallonea, leeches, honey, wax, saffron, madder, anise seed, linseed, turpentine, safflower, orpiment, meerschaum pipes, whetstones, carpets, silk and cotton fabrics, leather, copper, and metallic wares, with Arabian, Persian, Indian, and Chinese goods.

Next to Constantinople, Adrianople and Salonica are the chief centres of trade; the former, being a principal dépôt for goods brought to Constantinople from England, France, and Italy, supplies all the fairs throughout Roumelia and Bulgaria.

Next to Smyrna, Aleppo is the chief seat of commercial movements in Asia. Caravans bring to this mart pearls, shawls, Indian and Chinese goods, from Bussorah and Bagdad; camels from Arabia; cotton stuffs and thread, morocco leather, goats' hair, and galls, from the pachalics of Mosul, Diarbekir, Orfa, Aintab, etc.; furs, goats' hair, wax, gum-ammoniac, etc., from Asia Minor; silk, Mocha coffee, soap, scented woods, ambergris, drugs, and pearls, from Syria and Arabia; rice, coffee, and Egyptian produce, from Latakia; silk manufactures from Brusa and Damascus; European and United States cotton stuffs, woollens, printed muslins, hardware, watches, wrought amber, and fur, from Smyrna and Constantinople.

The treaty of Adrianople opened the Black Sea to the commerce of the world, and the passage of the Bosphorus and Hellespont is free to the flags of all nations. The importation of all articles of foreign commerce is admitted at extremely moderate duties. These are only 5 per cent., viz.: 3 per cent. on goods when landed, and 2 per cent. on their being admitted to consumption. The duties on exports of native production are 12 per cent., of which 9 per cent. is paid when the goods arrive at the port whence they are to be exported, and 3 per cent. on their being shipped. This is a very liberal tariff; though a reduction of the export duty, even should the import duty of 5 per cent. be raised to 10 or 12, would result most favorably to the commerce of Turkey with foreign countries.

Constantinople.—The harbor of Constantinople is deep, well sheltered, and sufficiently capacious to afford safe anchorage for 1200 of the largest-sized ships. Scutari, on the opposite shore of the Bosphorus, one mile distant from Constantinople, is the place of rendezvous for caravans from Persia, Armenia, and other

places in Asia that trade with European Turkey. It is also the seat of extensive silk, woolen, and cotton manufactures.

The only European countries with which the United States could successfully compete in the trade of this port are England and Austria. The vessels of the former import iron, colonial produce, cotton and woolen tissues; and from Trieste, Austria sends also colonial produce, such as cotton, sugar, molasses, rum, rice, tobacco, etc., and the various manufactures which are always found in abundance in the extensive warehouses of that port. The number of vessels which entered Constantinople in 1852 were: sailing vessels, 9220; steam vessels, 599; total, 9819. Of these there were from Austria 459 sailing vessels; from Great Britain, 584; from France, 244; from Brazil, 16; and from the United States, 5. The share assigned to these countries respectively, in carrying the trade of Constantinople during 1852, is thus given: Under the British flag there entered during the year 1687 sailing vessels, and 66 steam vessels; under the French flag, 236 sailing, and 55 steam vessels; and under the Austrian flag, 1280 sailing, and 213 steam vessels. Under the flag of the United States there arrived five sailing vessels, and one propelled by steam. It is estimated that Constantinople requires annually, for consumption alone, about 6,500,000 lbs. of coffee, 1,200,000 lbs. of sugar, 300,000 lbs. of pepper and spice, 2000 puncheons of rum, and large quantities of cheap cotton goods. These are supplied chiefly from the markets of Western Europe, Alexandria, and North and South America.

Salonica.—Next to Constantinople, Salonica (situated at the bottom of the Gulf of Salonica), the capital of Macedonia, is the most important port of Turkey in Europe. In 1850 its maritime commerce reached upward of \$3,500,000, viz.: about \$2,000,000 for imports, and \$1,500,000 for exports. The foreign trade of this port is chiefly engrossed by the British and French flags. The imports consist chiefly of cheap cotton and woolen cloths, and various other manufactures. Its exports are wheat, barley, maize, timber, wool, sponge, raw silk, wine, sesamum seed, tobacco, and staves. Colonial produce and manufactured goods are supplied to this port—the former from second and third hands—by England and Austria. There is nothing to prevent the United States from participating in the trade in this species of merchandise. Neither Austria nor England could compete with this country in supplying the vast quantities of colonial produce, and the cheap white and printed cottons, which are required for consumption in this market. In addition to the supplies needed to meet the daily wants of its 100,000 inhabitants, Salonica furnishes large quantities of colonial and manufactured goods for the yearly fairs of Parlepi, Lucca, and Seres, where the sales are always made for cash. The high price of French cotton and woolen cloths will always preclude the merchants of France from successful competition in this branch of trade; and the heavy expenses attending the circuitous trade through Marseilles, Smyrna, Constantinople, Trieste, and Venice, would necessarily favor direct exportations from the United States. The prices at Salonica are always from 10 to 12 per cent. higher than at Constantinople or Smyrna.

The navigation returns for the year 1853-'4 exhibit the following results:

	Inward.	Outward.
In 1853.....	118,498 tons.	111,767 tons.
In 1854.....	79,345 "	81,192 "

This decrease has been principally under Turkish and Greek flags, though there has also been a decrease under British, French, and Sardinian flags, but not in the same proportion.

The gross returns of trade at the port of Salonica, for the year ending December 31, 1854, show a considerable increase in the import trade, viz.: Value of

imports in 1854, \$3,770,295; and in 1853, \$2,857,765. But the returns exhibit a still more considerable increase in the value of the outward trade, viz.: Value of exports in 1854, \$5,492,980; and in 1853, \$3,476,050. This large increase, both in the inward and outward trade with the port of Salonica, may be regarded as an evidence of the improving state of the country.

Galatz, a town of Moldavia, Turkey, on the left bank of the Danube, in latitude 45° 25' N., longitude 28° E. Though at some distance inland, Galatz may be said to be the port of the Danube. Of the three principal mouths of the river, the Soulineh (or middle) mouth, in latitude 45° 10' 30" N., and longitude 29° 41' 20" E., is the only one accessible by vessels of large burden. The depth of water at its entrance varies from 10 to 14 feet; from the bar up to Galatz there is nowhere less than 18 feet. Lighters are stationed without the bar to partially unload large vessels. Vessels of 300 tons burden can lie at the quays.

COMMERCE OF MOLDAVIA IN 1855.

	Imports.	Exports.
Port of Galatz.....	1,377,683	126,451,025
By Austria.....	42,277,577	57,014,262
Total (piastres).....	43,655,315	163,465,288

Smyrna.—This port, the chief commercial emporium of Turkey in Asia, has an excellent harbor, and ships of large burden can load and discharge close to the quays. Its principal foreign trade is conducted with Great Britain, Austria, France, and the United States. Its exports consist of silk, raw cotton, carpets, copper, opium, hides, madder, wool, besides goats' hair and skins, vallonea, olive-oil, drugs, gums, sponge, figs, raisins, and nut-galls. Imports comprise coffee (upward of 6,000,000 lbs. annually); woolen, cotton, and silk fabrics; metals, raw and manufactured; sugar, indigo, spirits, cochineal, and spices. The following statement shows the quantities and values of wool imported into the United States from Turkey during the five years ending June 30, 1855, together with the aggregate quantities and values of the same from all countries during the same period:

Years.	From Turkey.		From all Countries.	
	Quantities.	Values.	Quantities.	Values.
1851.....	5,238,292	\$479,355	32,543,491	\$3,533,157
1852.....	3,355,320	281,656	18,341,28	1,930,711
1853.....	4,351,251	372,012	21,595,079	2,667,719
1854.....	4,360,326	460,285	20,200,110	2,322,185
1855.....	4,676,747	416,222	18,534,415	2,072,189
Aggregate.....	21,981,944	\$2,017,530	111,219,388	\$13,327,910
Annual aver.	4,396,389	403,506	22,243,878	2,045,582

From the Argentine republic the United States receives one-third of its raw wool. Next to this country ranks Turkey, in this regard; and the third place is due to Chili. In 1855, of the entire quantity imported, amounting to 18,534,415 lbs., valued at \$2,072,189, there came from Turkey 4,676,747 lbs., valued at \$416,222; of which Turkey in Asia supplied 4,261,250 lbs., valued at \$386,305. The principal imports into Smyrna, in vessels of the United States, are coffee, sugar, rum, coarse cottons, spices, and dye-stuffs; for which they carry home, in return, cargoes of wool, opium, copper, fruit, oil of roses, and wine. The navigation of Smyrna is steadily increasing. In 1840 there entered 969 vessels of all nations, measuring 107,596 tons; of which number there were 23 American vessels, measuring 4304 tons.—See SMYRNA.

The commerce of this port during 1851 amounted to nearly eleven millions of dollars. This trade was thus distributed:

Great Britain.....	31,396,563 francs.
Austria.....	13,856,808 "
France.....	7,954,177 "
United States.....	6,475,945 "
Russia.....	2,557,906 "
Holland.....	911,103 "
Sardinia.....	627,596 "
Tuscany.....	466,295 "
Belgium.....	184,763 "

Beyrout.—Beyrout is the sea-port of Damascus, and

the chief centre of the trade of Syria. Its imports consist of muslins, cottons, tin, hardware, cloths, and various kinds of manufactures. Its exports are silk, galls, madder, gums, wine, and oils. The imports at this port in 1851 amounted to about \$4,000,000, and its exports to \$8,000,000. During the same year there entered and cleared 2354 vessels, measuring an aggregate of 219,277 tons. The commercial movements of the port of Beyrout and its dependent trading towns, Tripoli, Caiffa, and Latakia, amounted in 1853 to a total of 45,689,142 francs, or an increase over 1852 of 4,500,000 francs. The following summary for these years is taken from French official authorities :

	Imports.	Exports.	Total.
In 1853.....	francs 23,848,740	21,840,402	45,689,142
In 1852.....	" 20,863,881	20,266,800	41,130,741

The tonnage employed in the trade of Beyrout the same years was : In 1853, 209,861 tons ; and in 1852, 241,978 tons. This decrease is owing to a falling off in the coasting trade, especially in cereals, occasioned by the short crops of 1853.

In the general import movement, England holds the first rank—tissues, cotton yarn, and cotton goods generally, being the chief imports from Great Britain into Syria. France occupies the second rank ; the imports from that country into Beyrout in 1853 amounting in value to 3,674,726 francs. Next to France comes Austria. The returns show a value of 6,714,242 francs assigned to imports under the Austrian flag ; but these figures include the value of all the merchandise imported in the Austrian steamers that ply between Constantinople and Smyrna. The actual imports from Austria into Beyrout amount to about one half of this sum. Trieste furnishes but little for the consumption of Syria. The imports into Syria from that entrepôt do not exceed 150,000 francs, and consist of colonial wares, and German tissues purchased in the warehouses of that city. Egypt supplies Syria, through the port of Beyrout, with grains, especially rice, to a value of about 2,467,950 francs. During the past few years mercantile houses of Boston, New York, and Philadelphia have established direct relations with Syria. The washed and unwashed wool of that country forms the basis of their operations. In 1854 the first cargo of refined sugar from Boston arrived at Beyrout. The success which has attended this enterprise will most probably lead to an important trade in this description of merchandise, in exchange for wool and other Syrian products. The chief obstacle to an immediate expansion of this trade appears to be the duty of 30 per cent. with which the raw wool is burdened in the United States, leaving but a small margin for profit on the importation of this leading product. How important this trade with Syria, as well as with Turkey generally, and other wool-producing countries might become, may be inferred from the following statement of facts. In 1855 there was imported into the United States, as already stated, 18,534,415 lbs. of wool. The annual production of wool in the United States, assuming that the quantity returned for 1850, as per United States census, affords a fair average—amounts to 52,516,959 lbs. This, added to the quantity imported, gives 71,051,374 lbs. The quantity annually exported reduces this figure, say, in round numbers, to 70,000,000 lbs. for consumption in the different and numerous manufactories in the United States. How much of this is consumed in the manufacture of carpets there is no means at hand of determining with any accuracy ; but it is stated in a publication of high authority—the *Scientific American*—that in the village of

Thompsonville, Connecticut, alone, there is used annually in the manufacture of Brussels, Axminster, and other costly qualities of carpeting, 10,000,000 lbs. of wool, or more than one half the whole quantity imported, and one-seventh part of the aggregate quantity imported and grown in the United States.

The value of the foregoing statement of facts will be better understood when it is added that the United States import annually—taking the importations of 1855 as an average—woolen manufactures of various descriptions to the value of \$27,000,000, of which England furnishes nearly two-thirds. The total number of woolen manufactories in the United States in 1850 was 1559 ; capital invested, \$28,118,650 ; lbs. of wool consumed, 70,862,829 ; value of raw material, \$25,755,991 ; hands employed, males, 22,678 ; females, 16,574 ; value of products, \$43,207,545—in which are included 82,206,652 yards of cloth, and 4,294,336 lbs. of yarn, besides blankets, hats, etc. Were the raw material supplied in sufficient quantities, the census of 1860 would probably add 100 per cent. to the preceding figures. The foreign trade of Beyrout is carried on principally by large class steamers, under the Austrian, French, and British flags, which visit this port regularly, and find always abundant freight, consisting of the products of Syria and the vast region which lies between Skaneroom and the rivers Euphrates and Tigris. The prosperity of Beyrout and the surrounding country is indicated by the fact, that while the population was only 8000 in the year 1844, it is now estimated at between 50,000 and 60,000. The steamers of the Austrian Lloyds Company, in March, 1856, are said to have numbered 59, with 10,000 horse-power, and a measurement of nearly 30,000 tons. The United States consul at that port, writing under date of October 5, 1855, says : " I learn, upon the best authority, that the people of this country consider the cloth manufactured in the United States superior in quality to that of England ; but since the pieces of American goods do not uniformly contain the same number of yards like the English pieces, they are slow to purchase, owing to the power of old ideas and habits. It would be of great service to the manufacturers if they understood this fact, and would regard it."

Candia.—The commerce of this island is conducted through the ports of Retino, Canea, and Candia. Its exports consist chiefly of olive-oil, barley, wheat, wine, raisins, cotton, flax-seed, almonds, Indian corn, and soap. The agricultural productions of Candia are estimated at a value of 18,500,000 francs per annum. Its manufactures amount in value to about 6,000,000 francs, of which soap appropriates 4,000,000, and coarse cloths for consumption 2,000,000 francs. There are on the island 47 soap factories, which yield annually about 13,000,000 lbs. of soap, and 3000 oil-presses in active operation. About 40,000 lbs. of silk are produced annually on this island, of a quality equal to that of Adrianople.

The imports and exports during a period of four consecutive years were :

	Imports.	Exports.
In 1848.....	\$1,050,195	\$812,666
In 1849.....	1,078,030	1,237,400
In 1850.....	1,154,215	2,007,845
In 1851.....	618,630	879,174

Total number of vessels arriving in the ports of Candia in 1853, 1178, measuring an aggregate of 50,747 tons. The imports during the same year reached \$1,028,212, and the exports \$1,972,713. The navigation and commerce of Candia for 1854 and 1855 are shown in the subjoined statement :

Ports.	Importations.			Exportations.		
	No. of Vessels.	Tons.	Value.	No. of Vessels.	Tons.	Value.
Canea.....	667	31,429	\$1,111,756 80	645	28,417	\$773,580 96

Rum	3,316
Soda ash	48,192
Tobacco	10,500
Cotton yarn	22,000
Brown cottons	9,000
Sundry manufactures	441,939

PRINCIPAL EXPORTS FROM CANDIA.

Articles.	Quantities.	Values.
Olive-oil	1,269	\$242,261 00
Soap	68,845	475,525 84
Sheep skins	13,352	1,784 48
Raw silk	8,525	22,320 00
Cheese	362	3,100 00
Oranges and lemons	5,000,000	1,800 00
Chestnuts	2,000	4,000 00

Candia abounds in produce adapted to the American market; but the direct trade between the United States and that island is as yet unimportant. So long, indeed, as the present duties of 30 and 40 per cent. are levied on their staple exports of coarse wool, olive-oil, soap, etc., it can scarcely be expected that this trade will increase to any considerable extent. It is stated, in a consular return from Candia, that a reduction of these duties, as well as of the duty on raw silk, would tend to establish a highly respectable and direct American intercourse with the ports of Candia, sufficient, probably, to compete with that of Great Britain and France. In consequence of the almost nominal duty upon the leading productions of the island in Great Britain, the commercial intercourse with England is fast increasing.

General Remarks on Turkey.—The treaty between the United States and the Ottoman Porte dates as far back as May 7, 1830. Its preamble, however, declares that it is "not limited as to duration," and it consequently regulates the intercourse between the countries at the present time. Its principal commercial features are—that the merchants of either country, in the provinces, ports, etc., of the other, shall pay the same duties and other imposts that are paid by the merchants of the most friendly or favored nation; and that merchant vessels of the United States shall have liberty to pass the canal of the imperial residence, and go and come in the Black Sea, in like manner as vessels of the most favored nation. The tariff of duties is based on an *ad valorem* system, viz.: Imports 5 per cent., and exports 12 per cent., including, as to both, internal duties. The value of merchandise may be revised every four or five years by commissioners on the part of the different governments, conjointly with agents appointed for that purpose by the Turkish government. The United States have hitherto appointed no commissioners for this adjustment of valuation; and it has been represented to the Department that the existing valuation on British merchandise, especially cotton goods and rum, subjects to heavy discriminations similar articles of the United States, owing chiefly to the difference in weight and prices. Since the return of peace, many improvements, tending to facilitate and improve the commercial intercourse of Turkey with foreign nations, have been completed or projected. Among others, the light-house system has undergone extensive improvements, and uniform light-dues established for the Bosphorus and Dardanelles, viz.: 50 piastres (between \$2 and \$2 50) for every 100 tons each strait, or 100 piastres per 100 tons for both, entering, and the same returning. At Constantinople there are, properly speaking, no port charges; but a small fee is required on vessels passing through the Golden Gate to discharge their cargoes.

The idea of connecting the Mediterranean with the

Red Sea by means of a ship canal across the isthmus of Suez has long been entertained. The level of the latter sea is known to be higher than that of the former by thirty-two feet, and the isthmus was at one time submerged. The levelings, with a view to a canal, which were prosecuted with care during the occupation of the French army, have been followed up by the Viceroy of Egypt, and a plan of the work has recently been settled by a European commission of engineers assembled in Paris to discuss the details. This commission has rejected all plans involving indirect routes across Egypt, and has adopted the principle of a direct cutting from Suez to the Mediterranean. The entrance into the Mediterranean, to be called Port Said, will have an inner basin, and the channel will be 1312 feet in breadth. The entrance at the Red Sea, the port of Suez, will also have an inner basin, and the channel will have a breadth of 984 feet. Capital sufficient for the accomplishment of this work is said to have been subscribed, and the work actually commenced. Another canal, which has long been contemplated, but opposed by Russia, as menacing the prosperity of Odessa and her trade in the Black Sea and the Levant, is now considered in a fair way of accomplishment. This canal will be about fifty miles in length, connecting the Danube with the Black Sea, and shortening the distance from Constantinople to Vienna some 500 miles, besides obviating the difficult navigation and the pestilential miasma near the mouths of that river. A charter has been granted, and a company of capitalists organized.—*Com. Rel. U. S.*

Consular Officers in Turkey.—In Mohammedan and pagan countries each Christian state asserts for its subjects more or less of exemption from the authority of the local sovereign. Thus, at the present time, throughout Christendom, the general rule prevails that foreigners are subject in all criminal and in most civil matters to the local jurisdiction; but in all Mohammedan and pagan states a different rule prevails.

The treaty between the United States and Turkey provides that "if litigations and disputes should arise between the subjects of the Sublime Porte and citizens of the United States, the parties shall not be heard, nor shall judgment be pronounced, unless the American dragoman be present. Causes in which the sum may exceed five hundred piastres shall be submitted to the Sublime Porte, to be decided according to the laws of equity and justice. Citizens of the United States of America, quietly pursuing their commerce, and not being charged or convicted of any crime or offense, shall not be molested; and even when they may have committed some offense, they shall not be arrested and put in prison by the local authorities, but they shall be tried by their minister or consul, and punished according to their offense, following in this respect the usage observed toward other Franks." Under the existing treaty between the United States and Turkey, our commerce is placed on the footing of the most favored nations; thus securing to our merchant vessels the privilege of trading to all the points of Turkey in Europe, Asia, and Africa, on the same conditions as those granted to the most favored nations. Thus our vessels may now trade to the ports of Egypt and Asia Minor, to the Turkish islands of the Archipelago, and to the Ottoman ports of Europe, and on the Asiatic shore of the Black Sea. This is at once an immense field for the enterprise of our merchants and seamen. Many facilities are thus offered for the extension of our commerce with the nations of the East; and consular officers may render important services to their countrymen by collecting all the information in their power in regard to the productions and commerce of these countries, and transmitting it to the State Department, by which it will be published from time to time for the general advantage of American citizens.—*See articles* CONSTANTINOPLE, BEYROUT, GALATZ, and SMYRNA.

COMMERCE OF THE UNITED STATES WITH TURKEY, THE LEVANT, ETC., FROM OCTOBER 1, 1820, TO JULY 1, 1857.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Turkey Red, a fine and durable red dyed upon calico and woolen cloth: the coloring matter used in its production is madder, but the process for producing it in perfection is tedious and complicated.—See BANCROFT on *Permanent Colors*.

Turmeric, the root of the *Curcuma longa*. It is externally grayish, and internally of a deep lively yellow or saffron color, very hard, and not unlike, either in figure or size, to ginger. That should be preferred which is large, new, resinous, difficult to break, and heavy. It is imported from Bengal, Java, China, etc. It has a somewhat aromatic and not very agreeable smell, and a bitterish, slightly acrid, but rather warm taste. It used to be in considerable estimation as a medicine; and is extensively used in India for culinary purposes, entering into the composition of curry powder and other articles: in Europe it is only used as a dye. It yields a beautiful bright yellow color, which, however, is extremely fugitive, and no means have hitherto been discovered of fixing it. It is sometimes employed to heighten the yellows made with weld, and to give an orange tint to scarlet; but the shade imparted by the turmeric soon disappears.—LEWIS'S *Mat. Med.*; BANCROFT on *Colors*.

Turpentine (Ger. *Turpentin*; Fr. *Térébenthine*; It. *Tremantina*; Russ. *Skipidar*; Pol. *Terpentina*). There are several species of turpentine, but all of them possess the same general and chemical properties.

1. *Common Turpentine* is a resinous juice which exudes from the Scotch fir or wild pine (*Pinus sylvestris*). The trees which are most exposed to the sun, and have the thickest barks, yield it in the greatest abundance. They begin to produce it when about forty years old. The bark of the tree is wounded and the turpentine flows out in drops, which fall into a hole, or sort of cup, previously dug at the foot of the tree, holding about 1½ pint. It is purified by being exposed to liquefy in

the sun's rays, in barrels perforated in the bottom, through which it filters. In the Southern States the collection of turpentine is chiefly confided to negroes, each of whom has the charge of from 3000 to 4000 trees. The process lasts all the year, although the incisions are not made in the trees till the middle of March, and the flow of the turpentine generally ceases about the end of October. The boxes are emptied five or six times during the year, and it is estimated that 250 boxes will produce a barrel weighing 320 lbs. Turpentine has a strong, somewhat fragrant odor, and a bitter, disagreeable taste: its consistence is greater than that of honey; its color dirty yellow; and it is more opaque than the other sorts.

2. *Venice Turpentine* is the produce of the larch (*Pinus larix*). It is obtained by boring a hole into the heart of the tree about two feet from the ground, and fitting into it a small tube through which the turpentine flows into vessels prepared for its reception. It is purified by straining through cloths or hair sieves. It is more fluid, having the consistence of new honey, a yellowish color, and is less unpleasant to the smell and taste than the common turpentine. Genuine Venetian turpentine is principally obtained from the forests of Baye, in Provence; but much of that to be found in the shops comes from America, and is, perhaps, obtained from a different species of fir.

3. *Canadian Balsam*, or *Turpentine*, is obtained from incisions in the bark of the *Pinus balsamea*, a native of the coldest regions of North America. It is imported in casks, each containing about 1 cwt. It has a strong, not disagreeable odor, and a bitterish taste; is transparent, whitish, and has the consistence of copalva balsam.

4. *Chian*, or *Cyprus Turpentine*, is obtained from the *Pistacia terebinthus*, a native of the north of Africa and the south of Europe, and cultivated in Chios and

Cyprus. It flows out of incisions made in the bark of the tree in the month of July, and is subsequently strained and purified. It has a fragrant odor, a moderately warm taste, devoid of acrimony or bitterness, and a white or very pale yellow color; it is about as consistent as thick honey, is clear, transparent, and tenacious. From its comparative high price, Chian turpentine is seldom procured genuine, being for the most part adulterated either with Venetian or common turpentine. The different species of turpentine may be dissolved in rectified spirit, or pure alcohol; and by distillation they all give similar oils, which, from their being distilled (and not from any resemblance to alcohol), are termed spirit of turpentine. If the distillation be performed with water, the produce is an essential oil, the common spirit of turpentine; and if the distillation be carried on in a *retort* without water, the product is more volatile and pungent—a concentrated oil, as it were—and is called the ethereal spirit of turpentine. The residuum that is left in both cases is a brownish, resinous mass, brittle, capable of being melted, highly inflammable, insoluble in water, but mixing freely with oils: it is the common rosin of commerce.—*Library of Entertaining Knowledge, Vegetable Substances; Thomson's Dispensatory.*

The manufacture of spirits of turpentine in the State of Alabama was commenced within the last eight years, and, although upon a very limited scale at first, the annual product has now reached upward of 1,600,000 gallons, and that of rosin to above 130,000 barrels. In North Carolina, where the business has been carried on for a much longer time, it is estimated that the annual product of spirits amounts to 800,000 barrels,

and this would give a residue of about 3,200,000 barrels rosin. Upon this estimate the value of the spirits of turpentine annually produced in the State of North Carolina is upward of \$14,000,000—nearly equal to the value of the annual agricultural product of the State of Maryland. Add to this the value of rosin when converted into oil, which at the present market value would be \$19,200,000, and we find a resource in this natural product of over \$33,000,000 in the State of North Carolina alone; and this estimate does not include the tar, pitch, and naphtha, which are necessary and merchantable articles, and would largely increase the amount.

Oil of Turpentine is the essential oil drawn from turpentine by distillation. There are two sorts of this oil: the best, red; and the second, white. It is very extensively used by house painters, and in the manufacture of varnish, etc. The distillers have been charged with using it in the preparation of gin. Oil of turpentine is very often adulterated.

Turpeth Mineral (from its yellow color, which resembles the powdered root of the *Convolvulus turpethum*), the yellow sub-persulphate of mercury.

Turquoise (Ger. *Türkiss*; Fr. *Turquoise*; It. *Turchina*; Sp. *Turquesa*), a precious stone in considerable estimation. Its color, which is its principal recommendation, is a beautiful celestial blue, which migrates into pale blue, and is sometimes tinged with green. Specific gravity, 8.127. It is destitute of lustre, opaque, and does not admit of a high polish. It is

much worn in necklaces, and every part of ornamental jewelry, from the size of a pin's head to that of an almond; it contrasts beautifully with brilliants or pearls set in fine gold.—*MAWE on Diamonds*. Real turquoises are exclusively furnished by Persia. The mines whence they are obtained are situated near Nishapore. They are the property of the crown, and are farmed to the highest bidder. They bring a rent of from £2000 to £2700 a year.—*FRASER'S Travels on the Shores of the Caspian*.

Turtle. This word is used to signify a species of dove (*Columba turtur*), and also a genus of Chelonian reptiles (*Chelone*, Brongn).

Tuscany. The Grand Duchy of Tuscany comprises an area of 8586 square miles, and contained in 1854 a population of 1,815,686 inhabitants. Its chief port is Leghorn, situated on the Mediterranean, and possessing extensive artificial facilities for commercial enterprise; indeed, the harbor is entirely artificial. Strictly speaking, Tuscany is an agricultural country—the valley of the Arno being generally considered the most fertile in Europe. The system of culture is, however, imperfect; and the consequence is, that the grain raised is insufficient for home consumption. Tuscany has long been celebrated for its mineral productions. Iron abounds in the island of Elba; copper, argenteriferous lead, sulphur, mercury, alum, coal, marble, and alabaster are found in different parts of the Grand Duchy; and borax is supplied in great abundance from the borax lagoons of Volterra.

The manufactures of Tuscany are in a highly flourishing condition. These consist of straw-plating and the manufacture of straw hats, and manufactures of silk; the principal seat of this latter branch of industry being at Florence, in which city alone there are upward of 4000 looms. There are also manufactures of wool, especially of woollen cloths and carpets; manufactures of linen, of paper, alabaster, marble, porcelain, hardwares, and of metal. The internal taxes levied on every branch of productive industry throughout the Tuscan territories have long fettered the commercial activity of the country. Furniture, machinery, books, live stock—in fact, every article in daily use, has to bear enormous duties. Every walled city has its own system of taxation, so that the manufactures of one town are burdened with oppressive duties (*octroi*) before they can be admitted for sale into another. Such a system necessarily results injuriously to the commercial enterprise of Tuscany; and its effects are perceptible in the stagnant condition of the foreign commerce of that country. The chief exports

of Tuscany are olive-oil, hides, straw hats, borax, rags, wool, hemp, potash, coral, marble, tallow, cork, building-timber, and paper; and the chief imports, colonial produce, salt fish, and British, German, Swiss, and French manufactures. The usual exports of the United States to Tuscany are naval stores: value thereof in 1854, \$3073, and in 1855, \$2930; spirits from molasses: value in 1854, \$6958, and in 1855, \$42,238; manufactures not enumerated, to the amount of between \$2000 and \$3000. In 1855 the exports of cotton from the United States to Tuscany amounted in value to \$4804, and of tobacco to \$171,621. The imports of the United States from Tuscany are chiefly silk, piece goods, olive-oil, almonds, figs, soap, small quantities of opium, and rags; this latter article averaging annually some six million pounds.

There is no commercial treaty between the United States and Tuscany; but American vessels enjoy perfect equality, as respects navigation and import duties, with the Tuscan flag—similar privileges having been granted to the Tuscan flag in the ports of the United States, per President's proclamation, Sept. 1, 1836.

The general foreign trade of Leghorn in 1851 was, in imports, \$14,442,900; and in exports, \$10,308,120. This is a falling off from the general trade of the preceding year of \$933,720. This diminution in the foreign trade of Leghorn, which is every year becoming more and more perceptible, is accounted for by the fact that a large portion of the extensive trade with Lombardy, Parma, Modena, and the Pontifical states, heretofore the principal source of the commercial prosperity of this port, has passed from Leghorn, and is now carried on through the ports of Genoa, Trieste, and Ancona. Besides, the port of Leghorn has of late years been much neglected, and offers neither inducements nor proper facilities to foreign flags. Ships of heavy draught can not enter the harbor, especially if laden; and there are no suitable warehouses, not even for the marble of Carrara, one of the leading exports to the United States. To these causes of the decline of the trade of Leghorn is to be added a tax of 3 francs 36 centimes for every person who goes ashore, should he remain but an hour. The merchant marine of Tuscany in 1851 comprised 700 vessels, measuring 27,000 tons—averaging less than 40 tons to the vessel. In the year 1849 there entered the port of Leghorn 1282 vessels (exclusive of 457 steamers), of which 26 were American; and there cleared 1139 (exclusive of 454 steamers), of which 24 were American. In 1851 the arrivals were 3418 vessels, of which 23 were American.

Quarantine.—The quarantine regulations of Leghorn are the most rigorous of any other port in the Mediterranean. Ships approaching Leghorn are visited by two guards sent from the health office, one of whom always acts as pilot. The most recent authority in the possession of the Department on this subject thus sums up the quarantine regulations of this port, so far as they relate to vessels arriving from American ports:

Days of Quarantine.—According to cases of suspicion for arrivals from America.

Clean Bills—Days of Observation.—First division:

from the equator to the tropic of Cancer; from 1st December to February inclusive, seven days; from 1st March to November inclusive, ten days; vessels of war two days less than merchant vessels. Second division: from the tropic of Cancer to Charleston inclusively, and from the equator to all South America, five days, from 1st December to February inclusive; seven days, from 1st March to November inclusive. Third division: from the United States between Charleston and Canada.

Doubtful Bills of Health—Days of Quarantine.—Laz-

aretto of St. Roch, all seasons, and wherever from, from 1st December to February inclusive, eighteen days; from 1st March to November inclusive, eighteen days; vessels of war, ten days; without susceptible commodities, rigid, fourteen days, from 1st December to February inclusive; eighteen days, from 1st March to November inclusive.

Foul Bills of Health—Days of Quarantine.—Lazaretto of St. Roch, all seasons, and wherever from, twenty-five days; without susceptible commodities, from 1st December to February inclusive, eighteen days; from 1st March to November inclusive, twenty-five days; susceptible commodities, days not given, but time supposed to be arbitrary, and dependent on the continuance of suspicious circumstances.

These regulations are still more rigid when vessels arrive from countries in which the plague has been known to exist. These include the Turkish Levant, Egypt, and Barbary. When vessels are subjected to a long quarantine, three medical visits are generally made; and when merely under inspection, two. In extraordinary cases a guard-boat is stationed near the vessel, and paid for at the rate of 64 cents per day. In all cases of assistance from sanitary officers, the commandant of the port determines the amount of compensation. The vessels of all nations, whether Tuscan or foreign, pay the same quarantine dues. These dues are, for each sanitary visit 80 cents, and \$1 08 for the boat conveying the health officer. For each guard, per day, 58 cents; or 48 cents if food is supplied. The tonnage duties amount to \$11 20 on a square-rigged vessel of 200 tons, with an additional charge of \$1 60 for every twenty-five tons over that capacity.—C. D.

Parma embraces an area of 2766 square miles, containing a population in 1854 of 508,784 inhabitants. The chief productions are maize, wheat, fruit, tobacco, and silk. The principal manufactures are silk fabrics, iron wares, glass, earthen-ware, paper, straw hats, and gunpowder. Commercially, Parma possesses but little interest, her importations being exclusively by land, and limited to small quantities of sugar, coffee, and a few articles of luxury, principally of dress and ornament. Her exports are cattle, hogs, sausages, and cheese.

Modena.—This state is of less extent than Parma, and its productions scarcely suffice for the subsistence of the inhabitants. It derives some commercial importance from the marble quarries at Carrara, which seem to be inexhaustible. The trade of both these states being inland, and but poorly supplied with any basis for commercial exchanges, is, of course, very inconsiderable. By treaty of December 4, 1849, the two states of Parma and Modena adopted the tariff of Austria, and duties are consequently levied at the same rates and in the same manner as those of that empire.

Lucca.—This little state was annexed to Tuscany October 11, 1847. This took place in virtue of provisions of the Congress of Vienna, when, upon the decease of the Archduchess Maria Louisa, the Duke of Lucca became ruler of Parma. The soil is exceedingly fertile, and the culture of oil and silk is acquiring some importance—the former being generally esteemed the best in Italy, and the latter of fair quality. The imports of Lucca, when an independent state, consisted chiefly of sugar, coffee, spices, wine and spirits, salt fish, hemp, flax, cotton, wool, and various manufactures. Salt and tobacco were government monopolies, and their importation on private account was prohibited. The exports were olive-oil, to an annual value of about \$160,000, and fresh fish, of \$50,000—the latter sent chiefly to Leghorn from the small port of Viareggio. In manufacturing industry Lucca is said to surpass both Parma and Modena. Silk is the most important manufacture; and next rank common woollens and cottons, giving employment, in all, it is estimated, to about 6000 persons, chiefly in the city of Lucca.

San Marino.—Rural industry and the manufacture of silk constitute the chief occupation of this little republic.

Monaco.—This small principality, under the protection of Sardinia, by the treaty of November 20, 1815, enjoys a fine climate, and produces oranges, lemons, and olives in abundance. It has also rich pasturages and productive fisheries. It need only be added respecting these small states, that such articles of their own produce and manufacture, or of the United States, as are interchanged, are so blended with the trade of other countries, that any attempt to specify the quantities or values of each respectively would prove abortive, even were the amounts sufficiently large to warrant the effort.—See articles AUSTRIA and TRIESTE.

Tutenag, the name given in *Commercial language* to the zinc or spelter of China.—See ZINC. This commodity used to be smuggled from China (the exportation of unwrought metals from that empire being prohibited) to Hindostan, the Malay Archipelago, and neighboring countries, to the amount, it is supposed, of about 50,000 cwt. a year. In 1820 the British free-traders introduced German spelter or zinc for the first time into the Indian market. In 1826 the importation of tutenag from China into Calcutta ceased; and it has now been totally superseded throughout India by spelter. Of this latter commodity there were exported from Great Britain, in 1850, to the East India Company's territories and Ceylon, 11,628 cwt., besides the quantities furnished by Hamburg, Rotterdam, Antwerp, and other Continental ports.

Typhoon, the name given to a violent tornado or hurricane in the Chinese seas.—See STORMS.

Tyre, the principal city of Phœnicia, and the most celebrated emporium of the ancient world. This famous city was situated on the southeast coast of the Mediterranean, where the inconsiderable town of Tsour now stands, in lat. 33° 17' N., long. 35° 14' 35" E. The trade that is at present carried on at Tsour is too trifling to deserve notice; but as this work is intended to give some account, however imperfect, of the revolutions in the channels of commercial enterprise, we may, perhaps, be excused for submitting a few statements with respect to the commerce carried on by so renowned a people as the Tyrians. Tyre was founded by a colony from Sidon, the most ancient of the Phœnician cities. The date of this event is not certainly known, but Larcher supposes it to have been 1690 years before the Christian era.—*Chronologie d'Hérodote*. It is singular, that while Homer mentions Sidon, he takes no notice of Tyre, whose glory speedily eclipsed that of the mother city; but this is no conclusive proof that the latter was not then a considerable emporium. The prophets Isaiah, Jeremiah, and Ezekiel, who flourished from 700 to 600 years before Christ, represent Tyre as a city of unrivaled wealth, whose "merchants were princes, and her traffickers the honorable of the earth." Originally, the city was built on the main land; but having been besieged for a lengthened period by the Babylonian monarch Nebuchadnezzar, the inhabitants conveyed themselves and their goods to an island at a little distance, where a new city was founded, which enjoyed an increased degree of celebrity and commercial prosperity. The old city was, on that account, entitled Palætyre, and the other simply Tyre. The new city continued to flourish, extending its colonies and its commerce on all sides, till it was attacked by Alexander the Great. The resistance made by the Tyrians to that conqueror showed that they had not been enervated by luxury, and that their martial virtues were nowise inferior to their commercial skill and enterprise. The overthrow of the Persian empire was effected with less difficulty than the capture of this single city. The victor had not magnanimity to treat the vanquished as their heroic conduct deserved. In despite, however, of the cruelties inflicted on the city, she rose again to considerable eminence. But the

foundation of Alexandria, by diverting the commerce that had formerly centred at Tyre into a new channel, gave her an irreparable blow; and she gradually declined, till, consistently with the denunciation of the prophet, her palaces have been leveled with the dust, and she has become "a place for the spreading of nets in the midst of the sea."

Commerce.—Phœnicia was one of the smallest countries of antiquity. It occupied that part of the Syrian coast which stretches from Aradus (the modern Rouad) on the north to a little below Tyre on the south, a distance of about 50 leagues. Its breadth was much less considerable, being for the most part bounded by Mount Libanus to the east, and Mount Carmel on the south. The surface of this narrow tract was generally rugged and mountainous; and the soil in the valleys, though moderately fertile, did not afford sufficient supplies of food to feed the population. Libanus and its dependent ridges were, however, covered with timber suitable for ship-building; and besides Tyre and Sidon, Phœnicia possessed the ports of Tripoli, Byblos, Berytus, etc. In this situation, occupying a country unable to supply them with sufficient quantities of corn, hemmed in by mountains, and by powerful and warlike neighbors on the one hand, and having on the other the wide expanse of the Mediterranean, studded with islands, and surrounded by fertile countries, to invite the enterprise of her citizens, they were naturally led to engage in maritime and commercial adventures; and became the boldest and most experienced mariners, and the greatest discoverers, of ancient times.

From the remotest antiquity, a considerable trade seems to have been carried on between the Eastern and Western worlds. The spices, drugs, precious stones, and other valuable products of Arabia and India, have always been highly esteemed in Europe, and have been exchanged for the gold and silver, the tin, wines, etc., of the latter. At the first dawn of authentic history, we find Phœnicia the principal centre of this commerce. Her inhabitants are designated in the early sacred writings by the name of Canaanites—a term which, in the language of the East, means merchants. The products of Arabia, India, Persia, etc., were originally conveyed to her by companies of traveling merchants or caravans, which seem to have been constituted in the same way, and to have performed exactly the same part in the commerce of the East, in the days of Jacob, that they do at present.—*Gen.* xxxvii. 25, etc. At a later period, however, in the reigns of David and Solomon, the Phœnicians, having formed an alliance with the Hebrews, acquired the ports of Elath and Ezion-geber, at the northeast extremity of the Red Sea. Here they fitted out fleets, which traded with the ports on that sea, and probably with those of Southern Arabia, the west coast of India, and Ethiopia. The ships are said to have visited Ophir; and a great deal of erudition has been expended in attempting to determine the exact situation of that emporium or country. We agree, however, with Heeren, in thinking that it was not the name of any particular place, but that it was a sort of general designation given to the coasts of Arabia, India, and Af-

rica, bordering on the Indian Ocean; somewhat in the same loose way as we now use the terms East and West Indies.

The distance of the Red Sea from Tyre being very considerable, the conveyance of goods from the one to the other by land must have been tedious and expensive. To lessen this inconvenience, the Tyrians, shortly after they got possession of Elath and Ezion-geber, seized upon Rhinocnura, the port in the Mediterranean nearest to the Red Sea. The products of Arabia, India, etc., being carried hither by the most compendious route, were then put on board ships, and conveyed by a brief and easy voyage to Tyre. If we except the transit by Egypt, this was the shortest and most direct, and for that reason, no doubt, the cheapest channel by which the commerce between Southern Asia and Europe could then be conducted. But it is not believed that the Phœnicians possessed any permanent footing on the Red Sea after the death of Solomon. The want of it does not, however, seem to have sensibly affected their trade; and Tyre continued, till the foundation of Alexandria, to be the grand emporium for Eastern products, with which it was abundantly supplied by caravans from Arabia, the bottom of the Persian Gulf, and from Babylon, by way of Palmyra.

The commerce of the Phœnicians with the countries bordering on the Mediterranean was still more extensive and valuable. At an early period they established settlements in Cyprus and Rhodes. The former was a very valuable acquisition, from its proximity, the number of its ports, its fertility, and the variety of its vegetable and mineral productions. Having passed successively into Greece, Italy, and Sardinia, they proceeded to explore the southern shores of France and Spain, and the northern shores of Africa. They afterward adventured upon the Atlantic, and were the first people whose flag was displayed beyond the Pillars of Hercules.

The commerce and navigation of Tyre probably attained their maximum from 650 to 550 years before Christ. At that period the Tyrians were the factors and merchants of the civilized world, and they enjoyed an undisputed pre-eminence in maritime affairs. The prophet Ezekiel (chap. xxvii.) has described in magnificent terms the glory of Tyre, and has enumerated several of the most valuable productions found in her markets, and the countries whence they were brought. The fir-trees of Senir (Hermon), the cedars of Lebanon, the oaks of Bashan (the country to the east of Galilee), the ivory of the Indies, the fine linen of Egypt, and the purple and hyacinth of the isles of Elishah (Peloponnesus), are specified among the articles used for her ships. The inhabitants of Sidon, Arvad (Aradus), Gebel (Byblos), served her as mariners and carpenters. Gold, silver, lead, tin, iron, and vessels of brass; slaves, horses, mules, sheep, and goats; pearls, precious stones, and coral; wheat, balm, honey, oil, spices, and gums; wine, wool, and silk, are mentioned as being brought into the port of Tyre by sea, or to its markets by land, from Syria, Arabia, Damascus, Greece, Tarshish, and other places, the exact site of which it is difficult to determine.—See M'CULLOCH's *Com. Dict.*

U.

Ultramarine (Ger. *Ultramarin*; Fr. *Bleu d'outre-mer*; It. *Oltramarino*; Sp. *Ultramar*; Russ. *Ultramarin*), a very fine blue powder made from the blue parts of *Lapis lazuli*. It has the valuable property of neither fading nor becoming tarnished on exposure to the air or a moderate heat, and on this account is highly prized by painters. Owing to its great price, it is very apt to be adulterated. It was introduced about the end of the 15th century.

Umbrella. Described in early dictionaries as "a portable pent-house to carry in a person's hand, to screen him from violent rain or heat." Umbrellas are very ancient. It appears, by the carvings at Persepolis, that umbrellas were used at very remote periods by the Eastern princes. Niebuhr, who visited the southern part of Arabia, informs us that he saw a great prince of that country returning from a mosque preceded by some hundreds of soldiers, and that he and each of the princes of his numerous family caused a large umbrella to be carried by his side. The old china-ware in pantries and cupboards shows the Chinese shaded by an umbrella. It is said that the first person who used an umbrella in the streets of London was the benevolent Jonas Hanway, who died in 1786.—HAYDN. Of late years the manufacture of umbrellas has been improved by the use of steel ribs instead of whalebone. The coverings are mainly confined to cotton, silk, gingham, and alpaca.

United Kingdom, a general term by which Great Britain and Ireland are designated.—See *articles* ENGLAND, GREAT BRITAIN, IRELAND, and SCOTLAND.

United States of America. Lat. 25° 20' and 49° N., and long. 67° 47' and 124° 30' W. Length, east and west, about 2600 miles; and breadth, north and south, about 1700 miles. The United States occupy the middle zone of North America. The frontier of this vast country measures about 10,000 miles in periphery, and of this about 4000 miles are sea-coast and 1500 lake coast.

The seat of government was established as follows: At "Philadelphia," Pennsylvania, commencing 5th September, 1774, and 10th May, 1775; at "Baltimore," Maryland, 20th December, 1776; at "Philadelphia," Pennsylvania, 4th March, 1777; at "Lancaster," Penn-

sylvania, 27th September, 1777; at "York," Pennsylvania, 30th September, 1777; at "Philadelphia," Pennsylvania, 2d July, 1778; at "Princeton," New Jersey, 30th June, 1783; at "Annapolis," Maryland, 26th November, 1783; at "Trenton," New Jersey, 1st November, 1784; and at "New York City," New York, 11th January, 1785; Washington City, district of Columbia, was first occupied in 1800.

Physical Features.—The United States are traversed by two ranges of mountains, the Alleghanies, and the great mountain mass of North America, the Rocky Mountains. These divide the country into three distinct geographical regions; the Atlantic slope, descending from the crest of the Alleghanies to the ocean on the southeast; the great Mississippi Valley, between the Alleghanies and the Rocky Mountains; and the western declivity, from the Rocky Mountains to the Pacific. The Alleghanies are a long plateau, crested with several mountain ridges, and groups separated from each other by wide and elevated valleys. They commence in Northern Alabama and Georgia, and reach their culminating point in North Carolina, where they attain an elevation of 6476 feet; thence passing northeasterly in parallel ridges, varying in height from 2000 feet to 6000 feet, and a breadth of from 20 to 100 miles, through Virginia, Pennsylvania, New Jersey, New York, Massachusetts, Vermont, New Hampshire, and Eastern Canada, where they terminate in the bold headland of Cape Gaspé. In New York they reach their highest elevations in the spur branching off northwesterly, known as the Catskill Mountains and the Adirondack group. In Massachusetts, at Mount Washington. In Vermont it attains its highest elevation in the Green Mountains, known as the Mansfield Mountain and the Camel's Hump. In New Hampshire, in the White Mountains; and in Canada, at Mount Logan.

The Rocky Mountains take a much greater breadth, and the culminating points reach the region of eternal snows, rising in the portion passing through the United States to the height of 14,000 feet. This is the great mountain range of the continent, traversing it from Cape Horn to the Arctic Ocean, forming the longest continuous mountain mass on the face of the globe. Between this range and the Pacific coast are some minor mountain ridges, whose culminations in several places rise far above the snow line, and furnish some active volcanoes.

The Mississippi River has its entire course in the territory of the republic, and the valley drained by it, and its numerous tributaries, is one of the most fertile tracts on the earth's surface. The most noted feature of the United States is the slightly inclined plain, which extends along the entire Atlantic coast, with a breadth of from 50 to 100 miles in width; beyond this plain commences the hilly country extending to the foot of the Alleghany ridge. The soil of the Atlantic plain is sandy, but in many places highly productive; and the hilly portion has a strong, fertile soil, capable of supporting a dense population. The Pacific section is traversed by several extensive rivers, and presents a much diversified surface, with varied and picturesque scenery; but some portions are mere desert wastes. Such is said to be the case with the great California basin, the water courses of which are lost in the sands and volcanic regions, or enter lakes with no visible outlet.

Lakes.—All the great lakes, with the exception of Michigan and Champlain, lie partly in Canada, the division line passing centrally through them, and their connecting streams, for a distance of about 1500 miles. The first (the most extensive sheet of fresh water on the earth's surface) in the series is Lake Superior, the surplus waters of which, descending through the Strait of St. Marys into Lake Huron, which, with the accu-

mulated waters from Michigan, pass through the St. Clair Strait and Lake, and the Detroit into Lake Erie; whence, passing over the precipice of Niagara, and through Niagara Straits, enter Ontario; Lake Ontario has its outlet by the magnificent St. Lawrence, through Canadian territory, into the Atlantic Ocean. The following is a tabular statement of the extent of these fresh-water seas, with their depth and elevation:

Lakes.	Mean Length.	Mean Breadth.	Area.	Mean Depth.	Elevation above Sea.
	Miles.	Miles.	Sq. Miles.	Feet.	Feet.
Superior....	400	80	52,000	900	598
Michigan...	320	70	22,400	1000	578
Green Bay...	100	20	2,000	1000	578
Huron.....	240	80	20,400	1000	578
St. Clair....	20	14	360	20	570
Erie.....	240	40	9,600	84	565
Ontario.....	180	35	6,300	500	232

Lake Champlain, lying between New York and Vermont, is 128 miles long, and from 1 to 16 wide, and discharges its waters through the Sorel into the St. Lawrence. It is computed that these lakes contain 14,000 cubic miles of water—a quantity more than five-sevenths of all the fresh water of the earth. The extent of the country drained by them from the northwest angle of Lake Superior to the St. Lawrence, including also the area of the lakes themselves, is estimated at 385,515 square miles.—*See LAKES, Commerce of.*

Rivers.—The water courses of the United States are on an extensive scale, and afford, with the great artificial connecting links, a system of inland navigation unsurpassed. First in order are those of the Atlantic slope, the waters of which enter directly into the ocean; the principal of these are the Penobscot, the Kennebec, the Merrimac, the Connecticut, the Hudson, the Delaware, the Susquehanna, the Potomac, the James, the Cape Fear, the Great Pedee, the Savannah, the Altamaha, and St. Johns, etc. These are all navigable streams, some for a great distance inland. Second, the rivers entering the Gulf of Mexico or Sea of Cortez. The Appalachicola, the Mobile, the immense Mississippi, the Sabine, the Trinity, the Brazos, the Colorado, and the Rio Grande. The rivers entering the Pacific are the Columbia, the Sacramento and San Joaquin, the Colorado, and Gila, the latter two discharging their waters into the Gulf of California. There are many rivers entering the great lakes, and also the St. Lawrence, the great artery of Canada.—*See rivers under proper names.*

A remarkable analogy exists in the structure of the land in the United States and Central and Northern Europe. Gneiss, mica, schist, and granite, prevail over wide areas in the Alleghanies; and on the Atlantic slope, and in the high and middle latitudes of the continent, silurian strata extend over 2000 miles. The Rocky Mountains, also, are mostly silurian, except the east ridge, which is of stratified crystalline rocks, amygdaloid, and ancient volcanic productions. The coast range has the same characteristics, with immense tracts of volcanic rocks, both ancient and modern, chiefly obsidian. In North America volcanic action is entirely confined to the coast and highlands along the Pacific; but within the United States at the present day this action is dormant (with the exception of Mount St. Helens), although its activity is very apparent both to the north and south—to the north in Mount St. Elias, and to the south in the Mexican volcanoes. The principal minerals produced in the United States are iron, coal, copper, lead, and gold, with a great number of less importance. Since 1848 the great field of gold gathering has been California, where large quantities have been obtained with little labor, and both silver and quicksilver abound in the same state. Silver, however, is mostly obtained from the lead and copper mines of the Upper Mississippi and Lake Superior countries, where it is found in combination with these metals. The principal deposits of gold, otherwise than those of California, occur in the

primary rocks between the River Rappahannock, in Virginia, and the Coosa, in Alabama; but it has been found in smaller quantities as far north as Maine. Gold and silver abound also in New Mexico and Western Texas, and probably in the Mesilla territory. The coal-fields of the States are of prodigious extent. Nearly one-fourth of the country between the Alleghanies and the Mississippi is composed of coal-beds; and in Pennsylvania, Maryland, Ohio, Indiana, and Illinois, coal-mining has become of vast importance to general industry. The ascertained areas of the coal formation in the under-mentioned States are as follows: In Alabama, 8400 square miles; Georgia, 150; Tennessee, 4300; Kentucky, 13,500; Virginia, 21,195; Maryland, 550; Ohio, 11,900; Indiana, 7700; Illinois, 44,000; Pennsylvania, 15,437; Michigan, 5000; and Missouri, 6000; total, 133,132 square miles. Coal has also been found on the Pacific slope—in California, Oregon, and Washington—and the mineral will no doubt be found in Texas and the adjoining country. As a general remark, it may be stated that the coal east of the highest Alleghanies takes the form of anthracite, while west, and in the valleys of the great central rivers, it is bituminous. Iron is equally abundant with coal, and is usually found in juxtaposition with it. The principal seats of iron mining are Pennsylvania, New Jersey, Ohio, Missouri, Kentucky, and Northern Michigan; and it is also extensively mined in Northern New York. Pennsylvania, however, is pre-eminent in this industry, and produces at least one half the iron mined in the United States. Copper is mined chiefly in Northern Michigan, but to a less extent in Connecticut, New York, Tennessee, North Carolina, etc.; and rich copper mines exist also in New Mexico, near the head of the Gila River. Lead is worked chiefly in Illinois, Wisconsin, and Iowa; on the Mississippi, and for many miles around the territory, in which are included Dubuque, Galena, and Mineral Point; and in these regions upward of 30,000 tons are annually produced. (With respect to other mineral products refer to the STATES severally.)

Historical Summary.—Eighteen new States have been admitted into the Union since the confederation of the original thirteen colonies, as follows:

1. *Vermont*, which formed a part of the territory of New York and New Hampshire, was admitted on the 4th March, 1791.
2. *Kentucky*, which was formerly a part of Virginia, was admitted on the 1st June, 1792.
3. *Tennessee*, formed from the territory ceded to the United States by North Carolina, and which afterward was known as the "Territory south of the Ohio River," was admitted on the 1st June, 1796.
4. *Ohio*, the first State formed from the "Territory northwest of the Ohio River"—a territory which had been ceded to the United States by Virginia and other claimants, and which was erected into a government as early as 1787, was admitted on the 29th November, 1802.
5. *Louisiana*, a part of the vast territory of the same name purchased of France by the United States in 1803, and subsequently known as the Territory of Orleans, was admitted on the 8th April, 1812.
6. *Indiana*, the second State formed to the northwest of Ohio, was admitted within its present limits on the 11th December, 1816.
7. *Mississippi*, which was formed from the territory ceded to the United States by South Carolina and Georgia, was admitted on the 10th December, 1817.
8. *Illinois*, the third of the Northwestern States, was admitted on the 8d December, 1818.
9. *Alabama*, the second State formed from the South Carolina and Georgia cessions, was admitted on the 14th December, 1819.
10. *Maine*, originally a province of Massachusetts, but having been permitted to frame a State government by that State, was admitted on the 15th March, 1820.

11. *Missouri*, the second State formed from the French purchase, was admitted on the 10th August, 1821.

12. *Arkansas*, the third State formed from the Louisiana cession, was admitted on the 15th June, 1836.

13. *Michigan*, the fourth State formed from the territory northwest of the Ohio River, was admitted on the 26th June, 1837.

14. *Florida*, which has the same limits as when ceded by Spain, was admitted on the 3d March, 1845.

15. *Texas*, which had been an independent republic for the ten preceding years, was admitted by a joint resolution of both Houses of Congress on the 29th December, 1845.

16. *Iowa*, the fourth State formed from the Territory of Louisiana, was admitted on the 28th December, 1846.

17. *Wisconsin*, the fifth State formed from the territory northwest of the Ohio River, was admitted on the 29th May, 1848.

And, 18. *California*, having been governed as a State for upward of a year, was admitted on the 9th December, 1850; and though the last, it is by no means the least important of the members of the great confederation.

Besides these thirty-one States, which send representatives to Congress, in number according to their population, there are several local and dependent governments, which are styled "Territories of the United States." Such are the Territories of Oregon, Washington, Utah, New Mexico, and Minnesota. The Territory of Nebraska is not yet organized, nor has the vast territory set apart for the Indians any aggregate existence, but each Indian nation, within its own limits, is governed by its own laws.

1. *Oregon* was erected into a Territory on the 14th August, 1848;

2. *Minnesota* on the 3d March, 1849;

3. *Utah*; and,

4. *New Mexico*, on the 9th September, 1850; and,

5. *Washington*, originally a part of Oregon, was formed into a separate Territory at the session of Congress 1852-53.

The only Territory now remaining without local government is that portion of the United States embraced in the Nebraska country, and the vast domain extending beyond Minnesota and Iowa westward to the Rocky Mountains, and north of the 43d parallel of north latitude. The tide of immigration, however, has already reached to the edge of the wilderness, and but a few years will elapse before settlement has progressed sufficiently to justify the organization of new governments within these immense solitudes.

The *District of Columbia*, or Federal District, is under the immediate authority of Congress, and is not represented in that body. It is the seat of the General Government.

Area of the United States.—The limits of the United States when their independence was achieved (1783) did not exceed 820,680 square miles. Louisiana, purchased from France in 1803, and Florida from Spain in 1819, added respectively an extent of 899,579 and 66,900 square miles. In 1842 and 1846 the Northern boundary was settled by treaties with Great Britain, confirming the rights of the United States to 308,052 square miles, included in the Territory of Oregon, etc. In 1846 Texas was annexed, with an area of 318,000 square miles, and by a treaty soon afterward with Mexico an area of 522,955 additional square miles was incorporated. Thus did the territory of the United States double itself in the first twenty years of its existence, and thus has it increased over three-fold in less than sixty years. The figures are given upon the authority of a statement prepared at the Topographical Bureau for the Census office, and annexed.

TERRITORIAL INCREASE OF THE UNITED STATES.

Territory.....	Square Miles.
Area of the United States at the peace of 1783	820,680*
The purchase of Louisiana added (about).....	899,579*
(The limits were indefinite; those here assumed are the boundaries of the treaty of 1819, with the exception of Florida and parts of Mississippi and Alabama.)	
The acquisition of Florida (treaty of 1819), added	66,900
Admission of Texas (Emory's map of 1844).....	318,000
Oregon treaty	308,052
Treaty with Mexico.....	522,955
Second treaty with Mexico	27,500
Total.....	2,963,666

The territorial extent of the republic is, therefore, nearly ten times as large as that of Great Britain and France combined; three times as large as the whole of France, Britain, Austria, Prussia, Spain, Portugal, Belgium, Holland, and Denmark, together; one and a half times as large as the Russian empire in Europe; one-sixth less only than the area covered by the fifty-nine or sixty empires, states, and republics of Europe; of equal extent with the Roman empire, or that of Alexander, neither of which is said to have exceeded 3,000,000 square miles.—VOLTAIRE, *Histoire de Russie*.

Considered in lesser divisions, the calculations of the Topographical Bureau show the existence of an interior valley drained by the waters of the Mississippi and its tributaries, nearly as large as the slopes of the Pacific and Atlantic proper together, and one-third larger than the whole domain of the republic upon the adoption of the present Constitution (1789).

AREA OF EACH SLOPE AND RATIO TO THE TOTAL AREA OF THE UNITED STATES.

Territory.	Area in Square Miles.	Ratio of Area of each Slope to total Area of United States.
Pacific slope	766,002	26.09
Atlantic slope proper.....	514,416	17.52
Northern Lake region	112,649	3.83
Gulf region	325,537	11.09
Atlantic, Lake, and Gulf east and west of the Mississippi	952,602	32.44
Mississippi valley, drained by the Mississippi and its tributaries	1,217,562	41.47
Atlantic, including Northern Lake	627,065	21.35
Mississippi valley and Gulf, or Middle region	1,543,999	52.55
By second treaty with Mexico	27,500	
Aggregate.....	2,963,666	

Thus over two-fifths of the national territory is drained by the Mississippi and its tributaries, and more than one half is embraced in what may be called its *Middle Region*. One-fourth of this total area belongs to the Pacific, one-sixth to the Atlantic proper, one-twenty-sixth to the Lakes, one-ninth to the Gulf, or one-third to the Atlantic, including the Lakes and the Gulf.

From the charts prepared some years ago by Colonel Gilpin, of Missouri, it will be perceived that a circle described from the forks of the Kansas River, west of Missouri, will touch New Orleans and Galveston, or the Gulf frontier, and the 49th parallel of latitude, our

northern boundary, making these points equidistant from the centre. On a larger circle, with the same centre, the points of equidistance will be San Francisco,

* These estimates are lower than those usually made. Morse, in his *Gazetteer*, estimates the area of the Union in 1783 at 1,000,000 square miles; and Major Stoddard, who took possession of Louisiana under the treaty and prepared a very valuable history of it, considers the area to be 1,507,260. These, of course, were but vague estimates, subject to after correction. Again, Oregon has generally been estimated at 341,463; Texas, 402,907; California, 448,691.—Dr Bow's *Industrial Resources*, vol. iii.

† The Mesilla valley is included in the computation.

in California, Fort Vancouver on the Columbia, in Oregon, Quebec and Boston upon the Atlantic, Hudson's Bay on the extreme north, and Havana, Vera Cruz, and the city of Mexico, on the extreme south. The various great basins, declivities, and table-lands on the continent he estimates as follows: Mississippi basin, 1,123,100 square miles; St. Lawrence, 475,400; Hudson's Bay, 1,077,200; Mackenzie basin, 898,500; Pacific declivity, 420,000; Atlantic declivity, 270,700 square miles.

Mr. Darby, in his *Geographical Dictionary*, gives the following aggregates: Valley of the Ohio, 200,000 square miles; Valley of the Mississippi proper, 180,000; Valley of the Missouri, 500,000; and the Valley of the Lower Mississippi, 330,000. Total, 1,210,000 square miles.

Lieutenant Maury compares the basins of the Old World with those which are drained into the Gulf of Mexico and Caribbean seas.

Mediterranean in Europe	1,160,000
Nile	520,000
Euphrates	196,000
Indus	312,000
Ganges	432,000
Irrawaddy	331,000
Others of India	173,000
Of Western Europe, Rhine, etc.	730,000

Total of Mediterranean India and W. Europe... 3,854,000

Basin of Mississippi	982,000
Basins in Florida and Texas	529,000
Mexico and Central America	300,000
Amazon	1,796,000
Orinoco and all others of the Caribbean Sea	700,000

Total of Gulf and Caribbean Sea... 4,298,000

Difference in square miles... 444,000

Lieutenant Maury remarks, "The area of all the valleys which are drained by the rivers of Europe which empty into the Atlantic, all the valleys that are drained by the rivers of Asia which empty into the Indian Ocean, and of all the valleys that are drained by the rivers of Africa and Europe which empty into the Mediterranean, does not cover an extent of territory as great as that included in the valleys drained by the American rivers alone, which discharge themselves into one central sea."

Dr. Patterson, of Philadelphia, made the centre of *representative population* of the Union in 1840 in the northwestern extremity of Virginia, and states that it had traveled westward since 1790, when it was in Baltimore county, Maryland, 182 miles in very nearly the same parallel of latitude.

The following table will show the area included within the several geographical divisions which are named:

AREA OF THE SEVERAL GREAT DIVISIONS OF THE UNITED STATES.

Area included in	Square Miles.	Per Cent. of total Area.
The States	1,464,106	49-86
The Territories	1,472,061	50-14
Non-slaveholding States not Territories	612,597	20-86
Slaveholding States not Territories	851,508	29-00
New England States	85,088	2-21
Middle States	114,624	3-90
Southern States	258,700	8-81
Southwestern States	474,435	16-15
Northwestern States	395,319	13-46
East of the Mississippi	865,576	29-48
Between the Mississippi and Rocky Mountains	1,200,381	40-88
West of the Mississippi	2,070,500	70-52
North of latitude 36° 30'	1,970,677	67-10
South of latitude 36° 30'	966,083	32-90
West of the Rocky Mountains	870,209	29-64
East of the Rocky Mountains	2,065,357	70-36

The United States consist at the present time (1858) of thirty-one independent States and nine Territories, including the District of Columbia, whose areas will be found in the table annexed, prepared at the Topographical Bureau. It is the only official statement. There were in 1850 sixteen hundred and twenty coun-

ty divisions included within the organized States and Territories, but it is impossible to give any satisfactory statement of their areas. By reference to the statistical tables of these counties in the United States Census Report, it will be found how liable they are to changes, and also what changes were actually effected between 1840 and 1850.

AREA OF THE STATES AND TERRITORIES OF THE UNITED STATES.

State or Territory.	Area in Square Miles.	Per Cent. of total Area.	Rank of States, etc. Territorially.
Alabama	50,729	1-73	20
Arkansas	52,198	1-78	18
California	155,980	5-32	7
Columbia, District of	60	...	40
Connecticut	4,674	0-15	37
Delaware	2,120	0-07	38
Florida	59,268	2-02	13
Georgia	58,000	1-98	14
Illinois	55,405	1-89	16
Indiana	33,509	1-15	29
Indian Ter. (S. of Kansas)	71,127	2-42	10
Iowa	50,914	1-73	19
Kansas	114,798	3-91	9
Kentucky	37,680	1-25	28
Louisiana	41,255	1-40	26
Maine	31,760	1-08	30
Maryland	11,124	0-38	32
Massachusetts	7,800	0-26	36
Michigan	56,243	1-91	15
Minnesota Territory	166,025	5-65	6
Mississippi	47,156	1-61	22
Missouri	67,880	2-29	11
Nebraska Territory	535,882	11-44	1
New Hampshire	9,280	0-32	34
New Mexico Territory	207,007	7-05	4
New York	47,000	1-60	23
New Jersey	8,320	0-28	35
North Carolina	50,704	1-73	21
Ohio	39,964	1-36	27
Oregon Territory	185,030	6-30	5
Pennsylvania	46,000	1-57	24
Rhode Island	1,306	0-04	39
South Carolina	29,885	1-01	31
Tennessee	45,600	1-55	25
Texas	237,504	8-00	2
Utah Territory	269,170	9-17	3
Virginia	61,352	2-10	12
Vermont	10,212	0-35	33
Washington Territory	123,092	4-19	8
Wisconsin	53,924	1-84	17
Area obtained by treaty with Mexico	27,500
Aggregate	2,993,666

The Territory of Nebraska constitutes one-ninth, Utah one-eleventh, Texas one-twelfth, New Mexico one-fourteenth, Oregon one-sixteenth, Missouri and Virginia a little more than one-fiftieth each, South Carolina one-hundredth, Massachusetts one-three hundred and eightieth, and Rhode Island one-two thousand three hundredth part of the national area.

In addition to the above States, it is proposed to add to the Union the States of Minnesota (the bill for the admission having already passed the Senate), Kansas, Oregon (and, when this territory shall be more developed, a further division of Oregon will take place, adding one or more States), Ontonagon (including the northwestern part of Michigan, and embracing territory as large in extent as New York State), Nebraska, and Washington. It is also proposed, when Texas shall increase sufficiently in population to make a division of that State advisable, to divide it into one or two more States. Ratios of representations for Congress, 1790 and 1800, 1 to 33,000; 1810, 35,000; 1820, 40,000; 1830, 47,700; 1840, 70,680; 1850, 93,420. Act of 1850 fixes the number of members at 233, to which afterward was added 1 for California; Massachusetts, Rhode Island, Connecticut, Pennsylvania, Maryland, Alabama, Tennessee, Kentucky, Missouri, Indiana, Texas, South Carolina, and Georgia, 1 member each for largest fractions. Future ratios of apportionment to be determined by the Secretary of Interior, by dividing the number 233 into whole *representative population*, giving States with largest fractions members to make up the total. Members from new States admitted shall be in addition to the 233 until the next census.

POPULATION, POPULATION TO SQUARE MILE, CAPITALS, AND POPULATION OF CAPITALS OF THE STATES AND TERRITORIES OF THE UNITED STATES IN THE YEAR 1850.

DENSITY OF POPULATION TO SQUARE MILE IN THE UNITED STATES.

Years.	Density.	Years.	Density.	Years.	Density.
1790.....	4-79	1820.....	5-39	1850.....	7-90
1800.....	6-47	1830.....	7-20		
1810.....	4-21	1840.....	9-55		

For an explanation of the principle upon which the following table may be constructed, see Professor TUCKER'S *Progress of the United States*, p. 107. By starting with the population of 1790 as a basis, which was 3,929,827, and adding three per cent. for every

year, making 4,047,721 for 1791, 4,169,152 for 1792, and so on for every year until 1850, Mr. Darby, the well-known geographer, arrived at results which, when compared with the particular census years, showed as follows:

Years.	Estimated.	Census.
1800	5,381,468	5,305,925
1810	7,035,964	7,239,814
1820	9,635,182	9,635,182
1830	12,811,118	12,866,020
1840	17,217,706	17,069,453
1850	23,138,004	23,191,876

AGGREGATE POPULATION OF THE UNITED STATES FOR EACH YEAR FROM 1790 TO 1860.—(THE RATE FROM 1840 TO 1850 IS ASSUMED AS DATA FOR THE NEXT DECADE.)

Years.	Aggregate.	Years.	Aggregate.	Years.	Aggregate.
1790...	3,929,827	1814...	8,117,710	1838...	16,131,087
1791...	4,049,600	1815...	8,353,338	1839...	16,593,630

1812...	7,666,206	1836...	15,244,344	1860...	30,986,851
1813...	7,888,729	1837...	15,681,447		

The national census was conducted under the direction of the Secretary of State until the formation of the Department of the Interior (March 3, 1849), when it was made a subordinate branch of that office. The statistics were obtained by the marshals of the district courts prior to 1850, and special deputies appointed under them. Several months were usually devoted to the labor; and the returns thus obtained, being subject to the errors arising from changes and removals in the interim, consequently were not always reliable.

The following is an estimate of the progress of population from the year 1860 to the close of the century:

Years.	Aggregate.	Years.	Aggregate.	Years.	Aggregate.
1861...	32,023,400	1875...	47,067,052	1889...	71,235,122
1862...	32,981,252	1876...	48,499,663	1890...	73,382,185

Agriculture.—The following table will show the relative number of farms, and quantity of acres in each in the several States and Territories of the United States, as well as the value of farms and implements. The unimproved land embraces such as is in occupancy and necessary to the enjoyment of the improved, though not itself reclaimed. Meadow-lands in all of the States, are therefore regarded improved.

FARMING LANDS AND IMPROVEMENTS OF THE UNITED STATES, 1850.

States and Territories.	Farms, Plantations, etc.	Acres of improved Land.	Acres of unimproved Land.	Average Number of Acres to each Farm.	Cash Value of Farms.	Value of Farming Implements and Machinery.	Average Value of Farms.	Average Value of Farming Implements and Machinery.	Average Value of Farms, Implements, and Machinery.

Total, 1850.....	1,449,075	113,032,614	180,528,000	203	\$3,271,575,426	\$151,587,638	\$258	\$105	\$2362

The average number of acres embraced in each farm in the United States is 203, valued at \$2258, and upon each farm there is an average of \$105 in implements and machinery. In Louisiana, so complicated is the sugar process, the average machinery is \$863 to the farm. By another table prepared by sections, it would seem that only about one-thirteenth of the whole area of the organized States and Territories is improved, and about one-eighth more is occupied and not

improved. In New England about twenty-six acres in the hundred are improved, in the South sixteen acres, in the Northwest twelve, and in the Southwest five. In the South the number of acres to the farm is largest, but the value per acre is most in the Middle States. The average value per acre for the Union, improved and unimproved, is \$11.14. The whole number of acres occupied is 293,560,614, or nearly one-sixth part of the national domain.—*Census Report of 1850.*

The annexed tables embrace the returns of agricultural products according to the census of 1840 and 1850. The quantity of wheat in 1850 is believed to be understated, and the crop was also short. Rough rice is returned for 1850, and clean rice for 1840. Corrections have been made in the cotton and sugar returns since the publication of the Quarto Census, pounds having been intended by the enumerators in many cases where they returned bales or hogsheads. It is impossible to reconcile the hemp and flax returns of 1840 and 1850. No doubt in both cases tons and pounds have often been confounded. In a few of the States, such as Indiana and Illinois, the returns of 1850

were rejected altogether for insufficiency. Letters from Kentucky entitled to high credit state the water-rotted hemp for that year to be not a third as much as the census gives, and the dew-rotted to be about 22,000 tons. In this case the whole hemp crop of 1850 may have reached 35,000 or 40,000 tons, and that of 1840 25,000 to 30,000 tons. By the manufacturing schedules it appears that 18,276 tons hemp were consumed by the manufacturers of Kentucky and Missouri, and by the receipts at the cities of St. Louis, Cincinnati, and New Orleans, with proper deductions, that fourteen or fifteen thousand tons hemp were exported in the rough to other States.

AGRICULTURAL PRODUCTIONS OF THE STATES AND TERRITORIES, 1840 AND 1850.

We give the estimates of the agricultural products of the United States for the year 1855, as furnished in an official form from the Patent-office. They can not be regarded as strictly correct, but they are as nearly so as possible. It will be seen that the crop of Indian corn for the year is estimated in value at \$360,000,000, while the wheat crop is estimated at only \$247,500,000. The cotton crop is estimated at \$136,000,000, while the hay and fodder crop is estimated at \$160,000,000.

Total.....		\$1,531,405,000

The aggregate for 1857 will, no doubt, prove much larger. It is quite apparent, from the foregoing, that this is an immense country, and that our resources are of vast extent and magnitude.

From official statements a comparison is made of the extent to which the various crops are raised in England and Wales and the United States. And from this it appears that England and Wales together have only 19 per cent. of the fallow culture of the United States, and only 33 per cent. of the improved land.

And the total number of improved lands in gross, etc.	37,324,915	113,032,614

From this comparison we can deduce that the United States has about five times as many acres in cultivation, and, if the same skill in cultivating and sowing were used, should be able to maintain five times the population, and that without having resource to any more wild lands.

STATEMENT OF THE RECEIPTS INTO THE NATIONAL TREASURY FROM CUSTOMS, INTERNAL REVENUE, DIRECT TAXES, AND SALES OF PUBLIC LANDS, TOGETHER WITH THE EXPENDITURES OF THE UNITED STATES, EXCLUSIVE OF PAYMENTS ON ACCOUNT OF THE PUBLIC DEBT, AND FROM TRUST FUNDS, FRACTIONS EXCLUDED.

Commerce.—By the Constitution of the United States, it is provided that Congress shall have power,

1. To lay and collect taxes, duties, imposts, and excises, to pay the debts, and provide for the common defense and general welfare of the United States; but all duties, imposts, and excises shall be uniform throughout the United States; 2. To borrow money on the credit of the United States; 3. To regulate commerce with foreign nations, and among the several States, and with the Indian tribes; 4. To establish a uniform rule of naturalization, and uniform laws on the subject of bankruptcies, throughout the United States; 5. To coin money, regulate the value thereof, and of foreign coin, and fix the standard of weights and measures; 6. To provide for the punishment of counterfeiting the securities and current coin of the United States; 7. To establish post-offices and post-roads; 8. To promote the progress of science and useful arts, by securing, for limited times, to authors and inventors

the exclusive right to their respective writings and discoveries; 9. To constitute tribunals inferior to the Supreme Courts; 10. To define and punish piracies and felonies committed on the high seas, and offenses against the law of nations; 11. To declare war, grant letters of marque and reprisal, and make rules concerning captures on land and water; 12. To raise and support armies; but no appropriation of money to that use shall be for a longer term than two years; 13. To provide and maintain a navy; 14. To make rules for the government and regulation of the land and naval forces; 15. To provide for calling forth the militia to execute the laws of the Union, suppress insurrections, and repel invasions.

Constitutional Powers.—The power "to regulate foreign commerce" enabled the government at once to place the whole country upon an equality with foreign nations; to compel them to abandon their narrow and selfish policy toward us; and to protect our own commercial interests against their injurious competitions. The power to regulate commerce "among the several States," in like manner, annihilated the causes of domestic feuds and rivalries. It compelled every State to regard the interests of each as the interests of all;

and thus diffused over all the blessings of a free, active, and rapid exchange of commodities, upon the footing of perfect equality. The words being general, the sense must be general also, and embrace all subjects comprehended under them, unless there be some obvious mischief, or repugnance to other clauses, to limit them. In the case there is nothing to justify such a limitation. Commerce undoubtedly is traffic; but it is something more—it is intercourse. It describes the commercial intercourse between nations and parts of nations in all its branches, and is regulated by prescribing rules for carrying on that intercourse.

The mind can scarcely conceive a system for regulating commerce between nations which shall exclude all laws concerning navigation; which shall be silent on the admission of the vessels of one nation into the ports of another, and be confined to prescribing rules for the conduct of individuals in the actual employment of buying and selling or barter. It may, therefore, be safely affirmed that the terms of the Constitution have at all times been understood to include a power over navigation as well as over trade, over intercourse as well as over traffic.—*STORY'S Familiar Exposition of the Constitution of the United States.*

STATEMENT EXHIBITING THE VALUE OF IRON, MANUFACTURES OF IRON, AND IRON AND STEEL, STEEL, SUGAR, WINES, AND ALL FABRICS OF WHICH WOOL, COTTON, SILK, FLAX, OR HEMP, IS A COMPONENT PART, IMPORTED INTO THE UNITED STATES FOR THE YEARS 1847, '48, AND '49, AND BRANDIES FOR THE YEARS 1853 AND 1857.

The power of Congress in laying taxes is not necessarily or naturally inconsistent with that of the States. Each may lay a tax on the same property without interfering with the action of the other; for taxation is but taking small portions from the mass of property, which is susceptible of almost infinite division. In imposing taxes for state purposes, a State is not doing what Congress is empowered to do. Congress is not empowered to tax for those purposes which are within the exclusive province of the States. When, then, each government exercises the power of taxation, neither is exercising the power of the other. But when a State proceeds to regulate commerce with foreign nations or among the several States, it is exercising the very power which is granted to Congress, and is doing the very thing which Congress is authorized to do. There is no analogy, then, between the power of taxation and the power of regulating commerce.—STORY.

Domestic Trade.—And first, among the States. It is not doubted that the power of Congress extends to the regulation of navigation, and to the coasting trade and fisheries, within as well as without any State,

wherever it is connected with the commerce or intercourse with any other State, or with foreign nations. It extends to the regulation and government of seamen on board of American ships, and to conferring privileges upon ships built and owned in the United States, in domestic as well as in foreign trade. It extends to quarantine laws, and pilotage laws, and wrecks of the sea. It extends as well to the navigation of vessels engaged in carrying passengers, and whether steam-vessels or of any other description, as to the navigation of vessels engaged in traffic and general coasting business. It extends to the laying of embargoes as well on domestic as on foreign voyages. It extends to the construction of light-houses, the placing of buoys and beacons, the removal of obstruction to navigation in creeks, rivers, sounds, and bays, and the establishment of securities to navigation against the inroads of the ocean. It extends also to the designation of a particular port or ports of entry and delivery for the purposes of foreign commerce. These powers have been actually exerted by the National Government under a system of laws, many of which commenced with the early establishment of the Constitution; and they have con-

tinued unquestioned unto our day, if not to the utmost range of their reach, at least to that of their ordinary application.

Many of the like powers have been applied in the regulation of foreign commerce. The commercial system of the United States has also been employed sometimes for the purpose of revenue; sometimes for the purpose of prohibition; sometimes for the purpose of retaliation and commercial reciprocity; sometimes to lay embargoes; sometimes to encourage domestic navigation, and the shipping and mercantile interest, by bounties, by discriminating duties, and by special

preferences and privileges; and sometimes to regulate intercourse with a view to mere political objects, such as to repel aggressions, increase the pressure of war, or vindicate the rights of neutral sovereignty. In all these cases the right and duty have been conceded to the National Government by the unequivocal voice of the people. It may be added, that Congress have also, from the earliest period of the government, applied the same power of regulating commerce for the purpose of encouraging and protecting domestic manufactures, and Congress have never abandoned the exercise of it for such a purpose.—*STORY on the Constitution.*

STATEMENT EXHIBITING THE VALUE OF FOREIGN MERCHANDISE, IMPORTED INTO THE UNITED STATES, RE-EXPORTED, AND CONSUMED ANNUALLY, FROM 1821 TO 1857, INCLUSIVE; THE ESTIMATED POPULATION AND CONSUMPTION PER CAPITA.

Years ending	Value of foreign Merchandise.			Population.	Consumption per Capita.	Imports entered for Consumption, exclusive of Specie.	Domestic Produce exported, exclusive of Specie.	Foreign Merchandise exported, exclusive of Specie.	Total Exports, including Specie.

SUMMARY STATEMENT OF THE VALUE OF THE EXPORTS OF THE GROWTH, PRODUCE, AND MANUFACTURE OF THE UNITED STATES DURING THE YEAR ENDING JUNE 30, 1897.

PRODUCT OF THE SEA.			
Fisheries:			
Oil, spermaceti	\$1,216,888	
Oil, whale and other fish	363,065	
Whalebone	1,307,322	
Spermaceti	34,917	
Spermaceti candles	85,121	
Fish, dried or smoked	570,343	
Fish, pickled	211,383	
PRODUCT OF THE FOREST.			
Wood:			
Staves and heading	\$2,055,980		
Shingles	212,805		
Boards, plank, and scantling	4,170,686		
Hewn timber	516,735		
Other lumber	638,406		
Oak bark and other dye	322,754		
All manufactures of wood	3,163,424		
Naval Stores:			
Tar and pitch	208,610		
Rosin and turpentine	1,544,572		
Ashes, pot and pearl	696,367		
Ginseng	58,331		
Skins and furs	1,116,041		
PRODUCT OF AGRICULTURE.			
Of Animals:			
Beef	\$1,218,348		
Tallow	632,286		
Hides	624,867		
Horned cattle	144,840		
Butter	593,084		
Cheese	647,423		
Pork (pickled)	2,805,867		
Hams and bacon	4,511,442		
Lard	5,144,195		
Wool	19,007		
Hogs	5,525		
Horses	195,627		
Mules	171,189		
Sheep	22,753		
Vegetable Food:			
Wheat	\$22,240,857		
Flour	25,882,316		
Indian corn	5,134,666		
Indian meal	957,791		
Rye meal	115,828		
Rye, oats, and other small grain and pulse	680,108		
Biscuit or ship bread	563,266		
Potatoes	205,616		
Apples	135,280		
Onions	77,048		
Rice	2,220,400		
Cotton			
Tobacco		
Hemp		
Other agricultural Products:			
Flax-seed	\$595	
Clover-seed	330,166	
Brown sugar	120,012	
Hops	84,852	
MANUFACTURES.			
Refined sugar	\$368,206	
Wax	91,983	
Chocolate	1,932	
Spirits from grain	1,243,234	
Spirits from molasses	1,216,635	
Spirits from other materials	120,011	
Molasses	108,003	
Vinegar	30,786	
Beer, ale, porter, and cider in casks	26,733	
Beer, ale, porter, and cider in bottles	16,940	
Linseed oil	54,144	
Spirits of turpentine	741,346	
Household furniture	879,448	
Coaches and parts, and railroad cars and parts	476,394

At 25 per cent.....	153,493
At 30 per cent.....	2,264,645
At 40 per cent.....	541,515
Paying duties.....	\$294,160,835
Free of duty.....	66,729,306
Total.....	\$360,890,141

Commercial Regulations of the United States, compiled from General Regulations of the Treasury Department, and from other official Authorities.—Vessels belonging to the following nations are admitted, under the provisions of law, treaties of commerce and navigation, or conventions, into the ports of the United States, on the same terms as American vessels, with the produce or manufactures of their own or any other country:

Argentine Confederation, Austria, Belgium, Brazil, Chili, (Denmark,*) Ecuador, Great Britain, Greece, New Granada, Guatemala, Hanover, Hanse Towns (Hamburg, Bremen, and Lübeck), Mecklenburg Schwe-
rin, Netherlands, Oldenburg, Peru, Prussia, Russia, San Salvador, Sardinia, Sweden and Norway, Tuscany, Two Sicilies,† Venezuela.

* The treaty between the United States and Denmark expired on the 14th day of April, 1856.

† By decree of December 13, 1854, equality with the national flag is offered by the government of the Two Sicilies to the vessels of such nations as reciprocate the favor. This equality applies to the direct and indirect trade.

Vessels belonging to the following nations, with which the United States have reciprocal treaties on the footing of "the most favored nations," or with which reciprocity exists by virtue of an act of Congress of the 24th day of May, 1828, are admitted into the ports of the United States on the same terms, as respects tonnage or navigation duties, as American vessels, with the produce or manufactures of their own or any other country: Bolivia, Costa Rica, Mexico, Muscat, Ottoman empire, Portugal, and Uruguay.

The Rights of Commerce.—"As the end of the law of nations is the happiness and general perfection of the general society of mankind, it enjoins upon every nation the punctual observance of benevolence and goodwill, as well as of justice toward its neighbors. They ought to cultivate a free intercourse for commercial purposes, in order to supply each other's wants and promote each other's prosperity. The variety of climates and productions on the surface of the globe, and the facility of communication by means of rivers, lakes, and the ocean, invite to a liberal commerce, as agreea-

ble to the law of nature, and extremely conducive to national amity, industry, and happiness. The numerous wants of civilized life can only be supplied by mutual exchange between nations of the peculiar productions of each; and who that is familiar with the English classics has not dwelt with delight on the description of the extent and blessings of English commerce, which Addison has given with such graceful simplicity and such enchanting elegance in one of the

Spectator's visits to the Royal Exchange! But as every nation has the right, and, if disposed to exercise it, of judging for itself in respect to the policy and extent of its commercial arrangements, the general freedom of trade, however reasonably and strongly it may be inculcated in the modern school of political economy, is but an imperfect right, and necessarily subject to such regulations and restrictions as each nation may think proper to prescribe for itself."—*KENT's Comm.*

STATISTICAL VIEW OF THE COMMERCE OF THE UNITED STATES, EXHIBITING THE VALUE OF EXPORTS TO AND IMPORTS FROM EACH FOREIGN COUNTRY, AND THE TONNAGE OF AMERICAN AND FOREIGN VESSELS ARRIVING FROM AND DEPARTING TO EACH FOREIGN COUNTRY DURING THE YEAR ENDING JUNE 30, 1857.—[OFFICIAL.]

Islands in the Pacific		743	743	743		
Total, 1856-'57	\$66,739,306	\$294,160,835	\$360,890,141	\$253,116,170	\$107,773,971	\$360,890,141
Total, 1856-'56	56,965,706	257,684,236	314,639,942	249,973,512	64,667,430	314,639,942

From the above table we get a clear exhibit of the direction of our foreign trade as regards the imports; making a brief summary, we see the proportion borne by the following countries during the year 1856-'57:

Countries.	Imports.	Per Cent.
England	\$193,473,529	54.71
France	43,792,827	12.14
Cuba	45,243,101	12.54
Brazil	21,460,733	5.94
Canada	18,291,834	5.07
British East Indies	10,766,214	2.93
Bremen	10,723,523	2.97
China	8,356,932	2.32
Scotland	7,216,111	2.00
Other countries.	71,565,337	19.83
Total	\$360,890,141	100.00

This summary shows that 80 per cent. of the total imports for 1856-'57 was to countries from which we imported over 2 per cent. Of the total of this 80 per cent. 51 per cent. (against 65 per cent. of exports) came from countries on the west coast of Europe, thereby showing a balance of trade in our favor in our commerce with these countries. A similar examination of our trade with the East Indies and countries in the south of Europe would show a balance of trade against this country. The same course of trade is also particularly to be remarked in regard to Cuba, Brazil, and China; as these three countries show, on an average, an aggregate balance of trade against the United States of over fifty millions of dollars.

COMMERCE OF THE UNITED STATES WITH THE PRINCIPAL COMMERCIAL COUNTRIES, EXHIBITING THE AGGREGATE VALUE OF IMPORTS FROM EACH COUNTRY, EACH YEAR, DURING A PERIOD OF THIRTY-SEVEN CONSECUTIVE YEARS, FROM 1821 TO 1857, BOTH INCLUSIVE.

* The figures for 1855 are the aggregate of those given in "Commerce and Navigation" for Russia on the Baltic and North Seas, on the Black Sea, and in American and Asiatic Russia, all embraced in prior reports under the single title, Russia.

† Italy, subsequently to 1844, is made to embrace all the Italian states—Sicily, Sardinia, Tuscany, Trieste, etc.; but after 1855, it embraces Sardinia, Tuscany, Papal states, and Two Sicilies, only.

‡ Hayti after 1855 embraces the totals given in "Commerce and Navigation" for Hayti and San Domingo (Dominican Republic), which were embodied in former reports under the single title, Hayti.

From these tables it appears that the principal increase in the countries of Europe was in Great Britain and its dependencies, France and its dependencies, Spain and its dependencies, Belgium and the Hanse

Towns. The South American states that show an increase are, Brazil, Argentine Republic, and Chili. The countries in the north of Europe generally show a decrease.

SUMMARY STATEMENT OF THE COMMERCE OF THE UNITED STATES WITH THE PRINCIPAL COMMERCIAL COUNTRIES, EXHIBITING THE AGGREGATE VALUE OF EXPORTS FROM THE UNITED STATES TO EACH COUNTRY, EACH YEAR, DURING A PERIOD OF THIRTY-SEVEN CONSECUTIVE YEARS, FROM 1821 TO 1857, BOTH INCLUSIVE.

VALUES OF EXPORTS FROM THE UNITED STATES TO—

Years.	Great Britain and Dependencies.	France and Dependencies.	Spain and Dependencies.	Netherlands and Dependencies.	Sweden and Dependencies.	Denmark and Dependencies.	Portugal and Dependencies.	China.	Hankow Towns.

* The figures for 1855 are the aggregate of those given in "Commerce and Navigation" for Russia on the Baltic and North Seas, on the Black Sea, and in American and Asiatic Russia, all embraced in prior reports under the single title Russia.

† Italy, subsequently to 1844, is made to embrace all the Italian states—Sicily, Sardinia, Tuscany, Trieste, etc.; but after 1855 it embraces Sardinia, Tuscany, Papal States, and Two Sicilies, only.

‡ Haiti after 1855 embraces the totals given in "Commerce and Navigation" for Haiti and San Domingo (Dominican Republic), which were embodied in former reports under the single title Haiti.

The following tables exhibit in a condensed manner the gross exports and imports from the United States each year from 1790 to 1821, inclusive; also the gross exports, domestic and foreign, the gross imports, the

exports and imports of specie, and the tonnage cleared from the United States each year from 1821 to 1857, inclusive. The marvelous growth of the foreign trade of this country can not be more clearly shown.

STATEMENT EXHIBITING THE GROSS VALUE OF EXPORTS AND IMPORTS OF THE UNITED STATES FROM 1790 TO 1821.

* Nine months to June 30, and the fiscal year from this time begins July 1.

The following table shows the extent and progress of the lake tonnage of the United States for the years 1855, 1856, 1857. This branch of our shipping has acquired such importance as to require a separate statement of its progress and extent. Table of vessels built at the American lake ports in the year 1857, including lakes Erie, Ontario, Huron, and Michigan.

	1855.		1856.		1857.	
	No.	Tons.	No.	Tons.	No.	Tons.
Steamers....	3	1,635	3	2,000	5	4,120
Propellers....	8	4,213	22	12,755	23	11,875
Tugs....	4	251	5	895	15	1,412
Barks....	1	776	5	2,438	3	1,364
Brigs....	6	1,742	1	434	2	869
Schooners....	105	28,752	121	34,328	57	28,642
Scows....	5	415
Total....	128	37,420	157	53,550	149	48,598

This gives our lake tonnage an increase in three years of

11 steamers.....	7,815 tons.
53 propellers.....	28,814 "
24 tugs.....	2,538 "
Total steam.....	39,217 "
10 barks.....	4,478 tons.
9 brigs.....	8,045 "
327 schooners.....	92,637 "
Total sail.....	100,160 "
Grand total.....	139,377 "

The value of this new tonnage is as follows:

Years.	Steam.	Sail.	Total.
1855.....	\$395,000	\$1,213,300	\$1,608,300
1856.....	1,132,000	1,604,450	2,736,450
1857.....	1,320,200	1,423,300	2,743,500
Total....	\$2,847,200	\$4,241,050	\$7,088,250

The total tonnage on the lakes in the Fall of 1857 was 588,868 tons, and the value of the same was \$15,195,100, or nearly forty dollars per ton.

STATEMENT OF AMERICAN AND FOREIGN VESSELS, WITH THEIR TONNAGE AND CREWS, WHICH CLEARED FROM THE UNITED STATES FOR FOREIGN COUNTRIES DURING THE YEAR ENDING JUNE 30, 1857.

Cleared for	American Vessels.				Foreign Vessels.				Total.

Navigation.—When our navigation laws were first enacted in 1789, the registered tonnage of the United States was secured against the protecting navigation laws of other nations by countervailing or protecting provisions. Such provisions were, from time to time, extended, so as to countervail the prohibitory enactments of the commercial nations with which we had intercourse. These commercial restrictions have grad-

nally yielded to the more liberal principles of free trade in the transportation of freight and passengers, until in that business we have free trade with almost all the nations of the earth, only marred by the charge of light-money to our vessels, where we charge none. The removal of restrictions, in our commercial intercourse with other nations, in the carrying business, has not been prejudicial to our foreign commercial marine. The burden of light-money, to which our tonnage, in the ports of Great Britain and other commercial nations, is subject, should be removed by mutual agreement, and the tonnage duty now charged on our vessels in the ports of France and some other countries, and on their vessels in our ports, should be taken off, and port charges equalized.

NUMBER AND CLASS OF VESSELS BUILT, AND THE TONNAGE THEREOF, IN EACH STATE AND TERRITORY OF THE UNITED STATES, DURING THE YEAR ENDING JUNE 30, 1857.

The limited space allotted to the article UNITED STATES in this work precludes any attempt to give more than the statistics of the production, commerce, and navigation of the United States proper. Under their separate heads are given the imports and exports of every article of commerce—as COTTON, BREADSTUFFS, RICE, SUGAR, TOBACCO, etc.; also the trade of each individual State under its proper head; and under their proper heads the commercial law and the latest statistics regarding the United States in subjects—as COINS, COMMERCE, CANALS, CONSULS, RAILROADS, TELEGRAPH, SHIPPING, TONNAGE, etc. To all of which reference is made for more particular information regarding the United States.

Uruguay. This small republic, known also as the Banda Oriental, or the Cisplatine Republic, lies on the north coast of the estuary of the Rio de la Plata, and contains a population estimated at 120,000—the least of any of the South American States—of which about 16,000 reside at the capital, Montevideo. The soil of Uruguay is fertile, well watered by large rivers, and is peculiarly adapted to grazing and agriculture. Animal products are the staple domestic exports, and consist principally of hides, dry or salted, of horned cattle and horses; tallow, grease, bones, animal carbon, horns, horse-hair, cow-tails, sheep-skins, and wool.

Though there is no treaty existing between the United States and Uruguay, our commercial intercourse is on a footing of equality with that of other countries; being favored by no privileges, and being subjected to no restrictions not common to all other foreign nations. This intercourse is regulated by the legislation of the republic, and during the past few years has undergone several liberal and important modifications. Prior to 1849, an exorbitant impost of \$15 per barrel was levied on the article of flour. By decree dated April 6th of that year, this duty was reduced to \$2 50 per barrel, with a provision that "this impost shall last no longer than necessary to pay the debt incurred on the article of flour, the liquidation of which shall commence immediately." By subsequent decrees of April, 1852, the export duty on horse-hides, dry or

salted, and the transit duties upon all merchandise were abolished; and the former duty of 20 cents per hide on ox and cow hides, dry or salted, was reduced to 7½ cents per hide. By the new tariff, however, of October 11, 1853, now in force, the duty on flour is fixed at 35 per cent.; and all products of the country, and all foreign merchandise free of import duty, or that has paid such duty on importation, are free of duty on being exported. The transit duty is also abolished. This tariff has been superseded by another, bearing date July 19, 1856. The provisions referred to remain, however, quite the same.

The port regulations are liberal—vessels being allowed to remain in port twelve days without entering at the custom-house, and to land samples, so as to dispose of a part or the whole of their cargoes. Should they leave within that period without effecting a sale, they are subject only to pilotage, health-visit, bill of health, and stamps.

A treaty of commerce and navigation, etc., was ratified between England and Uruguay, July 17, 1843, which expired toward the close of 1853, and was not renewed at the latest dates from Montevideo. With France a preliminary treaty was concluded April 8, 1836, to continue in force until another treaty should be agreed upon; or, should none such be subsequently entered into, then to continue fifteen years. The treaty with England, now lapsed, was based upon a principle of reciprocity; and that with France is upon the principle of the most favored nation. The merchant marine of Uruguay, it is believed, comprises but few, if any, vessels of more than sixty tons burden. It consists of about 300 vessels of between twenty and fifty tons each, averaging each about six men, or from 1800 to 2000 men in all. These are mostly engaged in the internal and coasting trade, the latter chiefly with Brazil; which trade is also open to foreign vessels, on the payment of the discriminating tonnage. Besides the above, there are five vessels, all of foreign construction, under the Uruguayan flag, measuring in the aggregate about 1500 tons, which make voyages north of the equator.

COMMERCE OF THE UNITED STATES WITH URUGUAY (FORMERLY CISPLATINE REPUBLIC), FROM OCT. 1, 1830, TO JULY 1, 1857.

* Nine months to June 30, and the fiscal year from this time begins July 1.

In 1854, the number of vessels under the United States flag which entered the port of Montevideo was seventy, with an aggregate tonnage of 22,043 tons; and the number cleared was thirty-nine, with an aggregate tonnage of 12,701 tons. Imports from the United

States in 1854, according to official returns of Uruguay, consisted of rum, 453 barrels; spirits of turpentine, 262 barrels; starch, 2556 casks and boxes; rice, 2169 casks; refined sugar, 1797 casks; codfish, 312 boxes; tubs and buckets, 529 dozen; bitumen, 133 barrels;

cinnamon, 150 boxes; Chinese crackers, 998½ packages; brooms, 1474 dozen; flour, 19,993 barrels; hams, 2900; gin in bottles, 34,438 dozen; gin in demijohns, 31,748; gin in pipes, 200; lumber, 3,662,881 feet; chairs, 1655 cases; tobacco (chewing), 1142 boxes; stearin candles, 1070 boxes.

By a decree of October 11, 1853, the government of Uruguay opened to all flags the navigation of the rivers and streams of the republic, on a footing of equality with the national flag; which decree was superseded by a brief enactment of June 17, 1854, as follows: *Art. 1.* The navigable rivers and streams of the republic are open to the navigation and commerce of all nations. *2.* In the navigation of the rivers and streams, foreign vessels are subjected to the same regulations of police and of custom-houses with national vessels. The precise meaning of this act was at first in some doubt. It did not expressly declare whether or not it was applicable to the port of Montevideo. Upon reference to the government of Uruguay, however, by the agents of foreign governments resident at that port, it was announced that the law applies to the port of Montevideo.

Usance, a period of *one, two, or three months*, or of a fixed number of days, after the date of a bill of exchange, according to the custom of different places, before the bill becomes due. Double or treble usance is double or treble the usual time; and half usance is half the time. When a month is divided, the half usance, notwithstanding the differences in the lengths of the months, is uniformly fifteen days. Usances are calculated exclusively of the date of the bill. Bills of exchange drawn at usance are allowed the usual days of grace, and on the last of the three days the bill should be presented for payment.—*See* **BILLS OF EXCHANGE** and **EXCHANGE**.

When a bill is drawn at a certain number of days after date or after sight, those days are reckoned exclusive of the day on which the bill is drawn or accepted, and inclusive of the day on which it falls due. "After sight" is equivalent to "after acceptance;" and with regard to notes, it means "after presentment for sight." By the custom of trade, in bills and notes, a month is deemed to be a calendar or solar month. The irregularity of the respective months is not taken into the account. If a bill at one month be drawn on the 31st January, it will be due on the 28th of February, or 29th if leap-year, and, reckoning the days of grace, will be payable on the 3d of March.

The three days of grace generally allowed are reckoned exclusive of the day on which the bill falls due, and inclusive of the last day of grace. When there are no days of grace, and the bill falls due on a Sunday, Christmas-day, or Good Friday, public fast or Thanksgiving-day, or when the last of the days of grace happens on such a day, the bill becomes payable on the day preceding, and if not then paid must be treated as dishonored. A presentment for payment before the expiration of the days of grace is premature, and will not entitle the holder to charge the antecedent parties.

Days of grace are allowed on promissory notes as well as on bills, but they are not allowed on checks, or on bills or notes payable on demand.

When a month is the ordinary usance, a half usance is fifteen days.

The calculation of the time depends upon the different modes of computing time.

All places with which we are in the habit of negotiating bills compute their time as we do (except that Russia adheres to the old style), by years reckoned in a series from the birth of our Saviour, and divided each into twelve months, or 365 (or in every fourth year, 366) days.

Upon a bill drawn at a place using one style, and payable at a place using the other, if the time is to be reckoned from the date, it shall be computed according to the style of the place at which it was drawn; otherwise according to the style of the place where it is pay-

able; and in the former case the date must be reduced or carried forward to the style of the place where the bill is payable to the time reckoned from thence.

Thus, on a bill dated the 1st May, old style, and payable here two months after date, the time must be computed from the corresponding day of May, new style, viz., May 13th; and on a bill dated 1st of May, new style, and payable at St. Petersburg two months after date, from the corresponding day of April, old style, viz., April 19th.—*LEONIE LEVI'S Com. Law of the World*, vol. i. p. 24.

Usquebaugh, an Irish spirituous liquor, compounded of spirits, raisins, cinnamon, and cloves.

Usury, an illegal rate of interest or compensation for the use of money. Usury is generally supposed to be unequivocally condemned in the Scriptures; but it must be remembered that the present signification of the term is very different from that in former times. We find in Exodus, xxii. 25, "If thou lend money to any of my people that is poor by thee, thou shalt not be to him as an usurer, neither shalt thou lay upon him usury;" and in Leviticus, xxv. 35, "If thy brother be waxen poor * * * * take thou no usury of him or increase." It will be seen from these extracts that the taking of any compensation from the poor is forbidden, and not a limited rate is regarded as usury. We apprehend that, in a strict acceptation of the term, 7 per cent. per annum is usury, as well as the same per cent. a month. In the present time, however, no arguments are needed to prove that money is a merchantable commodity, and therefore as much a matter of profit and subject to fluctuation as other merchandise. We will, therefore, confine ourselves to a short account of the efforts to repeal this relic of a past age, and the laws now in force in the different States.

The repeal of the usury laws in Great Britain took place August 5th, 1854, by an act of the British Parliament. Such an important change in the commercial policy of that country could not have been adopted either suddenly or without mature consideration. In fact, the change had been going on gradually for more than twenty years; and the advantages of experience were thus sought from time to time, as the restrictions were, step by step, removed, and the commercial circles of the country thus finally relieved from the operation of the former vicious laws. In the year 1833 the first important innovation upon the usury-law policy was made in England.

After four years' trial, it was found that commercial and manufacturing people of all classes pronounced the new features of the law to be advantageous in their operation to borrowers, if not to lenders. The next step was in the year 1837, when Parliament granted further relief by removing the usury restrictions upon all commercial paper having twelve months or less to mature. This would seem to cover the ground entirely, and to furnish all the relief that commercial circles could reasonably demand. But so satisfied were the English people and the English government, that the usury laws, even in their mildest form, were inoperative or prejudicial, that, after various petitions and investigations, the total abolishment of these laws was effected on the 5th August, 1854. The bill to this effect had passed the House of Lords on the 27th July preceding, and was immediately brought forward in the House of Commons, where it was favorably considered and finally passed. The passage of the bill was strongly urged in the House of Lords by the Marquis of Lansdowne, by Lord Campbell, and the Lord Chancellor. Lord Brougham supported the bill, both on mercantile and moral grounds. The Marquis of Lansdowne remarked that:

"The inconvenience which had been found to result from the operation of the laws against usury had been so many and so great, that notwithstanding strong prejudices on the subject of usury and usurers, it had been found necessary to relax those laws from time to

time. At the time of the commercial failures in the years 1836 and 1837, it was found that the greatest relief which was experienced was the result of a provision which had been introduced not long previously into the act for the renewal of the Bank charter, enabling the Bank of England to dispense with the usury laws."

Many people, in their aversion to any modification of the usury laws, are under the conviction that if the price of money is not regulated by law, they will be compelled to pay an enormous tax (ranging from 25 to 75 per cent. per annum) on loans of money. Those who seriously reflect upon the matter—who have any practical or familiar knowledge of the laws of trade—are unanimous in their opinions that all shackles of the kind should be permanently removed.

If we examine the usury laws of the different States, we will find in all elaborate and stringent enactments providing punishment and penalties for the exercise of every one's inalienable right; namely, that of using their property to the best advantage.

We give a synopsis of the usury laws of the United States as they are now in force.

States.	Legal Int.	Penalties.
Maine.....	6 per cent.	Loss of excess of interest and law costs.
N. Hampshire. 6	"	Loss of three times excess of interest.
Vermont..... 6	"	Loss of excess of interest.
Massachusetts. 6	"	Loss of three times the whole interest and law costs.
Rhode Island... 6	"	Loss of excess of interest.
Connecticut... 6	"	Loss of all interest.
New York 7	"	Forfeiture of contract; and, in criminal action, fine not exceeding \$1000, and imprisonment not exceeding six months.
New Jersey ... 6	"	Contract void, and principal and interest forfeited.
Pennsylvania . 6	"	Principal and interest forfeited.
Delaware..... 6	"	Principal and interest forfeited.
Maryland..... 6	"	Loss of excess of interest.
Virginia..... 6	"	Usurious contracts void.
North Carolina 6	"	Principal and interest forfeited; and, if usury is paid, double the amount of principal and interest.
South Carolina 7	"	Loss of interest.
Georgia..... 7	"	Loss of interest.
Alabama..... 8	"	Loss of interest.
Arkansas..... 6	"	Loss of interest.
Florida..... 6	"	Loss of interest.
Illinois..... 6	"	10 per cent. allowed on contract, and loss of interest if exceeding this.
Indiana..... 6	"	Loss of five times the interest.
Iowa..... 6	"	10 per cent. allowed on contracts. Forfeiture of excess of interest.
Kentucky..... 6	"	Loss of interest.
Louisiana..... 8	"	Loss of interest.
Michigan..... 7	"	10 per cent. allowed on contracts. Forfeiture of excess of interest.
Mississippi.... 6	"	10 per cent. allowed on contracts. Forfeiture of excess of interest.
Missouri..... 6	"	10 per cent. allowed on contracts. Forfeiture of excess of interest.
Ohio..... 6	"	10 per cent. allowed on contracts. Forfeiture of excess of interest.
Tennessee... 6	"	Liable to an indictment for misdemeanor. Forfeiture of usurious interest, and fined.
Texas..... 8	"	12 per cent. allowed on contracts. Forfeiture of all interest.
Wisconsin 12	"	Loss of interest.
California 10	"	No penalty.

From this synopsis we see that the usury laws of New York are the most rigorous, and include, in criminal actions, a fine of \$1000 and imprisonment of six months; in merely civil actions, a forfeiture of contract.

California is the only State that provides no penalty. The Territories are also not subject to any usury laws.

No argument is needed to prove that such absurd laws are clogs on the commercial prosperity of the country, and that in financial revulsions like the present they effectually prevent the exercise of any commercial elasticity. A parallel could be found by supposing restrictive laws against selling flour above \$5 per barrel; we would then run as good a chance of starving as our merchants do of commercially starving for want of money when there is an abundance around them, but when the legal interest does not pay capital-

ists for the risk.—See articles BANKS, COMMERCE, INTEREST, etc. For Usury Laws, Discussions on, etc., see *Edinburgh Review*, xxvii. 339 (Defense of); *American Quarterly Review*, xxii. 177, xxi. 145; *North American Review*, xxxix. 168 (A. McCulloch), v. 781, 842, viii. 845, ix. 241-248 (M'VICKAR), 811; *Hunt's Merchant's Magazine*, iii. 516, v. 40, 115; *Dem. Rev.*, xxvii. 221-328; *Quar. Rev.*, xxxiii. 186.

Utah, a territory of the United States, mostly comprised in the Great California Basin, and extending from the crest of the Rocky Mountains on the east to the Sierra Nevada on the west. It has Oregon on the north, California on the west, and New Mexico on the south. Area, 208,775 square miles. In 1850 it was divided into seven counties, and the number of dwellings and population were as follows: Dwellings, 2322; white inhabitants, 11,330; free colored, 24. The counties erected since 1850 are Deseret, Green River, Milard, Juab, and Washington.

The eastern portion of Utah is drained by the Colorado River of the Gulf of California. Its valley has been but imperfectly explored, but, as far as our knowledge exists of it, a very small portion of it only can be brought into cultivation. The remaining portion of Utah is comprised in the Great Basin, and forms a distinct and most peculiar region. The rivers all terminate within its limits, in lakes with no visible outlets. The Great Salt Lake is about 35 miles broad and 70 long, and the waters contain more salt than can be held in solution; hence its borders abound with crystallized salt, and the bottom of the lake is incrustated with it. No living creature can exist in its waters. The valleys are susceptible of cultivation, and are very fertile, where they can be irrigated. Timber, although scarce, is very durable. Iron ore exists in the mountain ridges, and several furnaces are already in operation smelting it. The temperature is more uniform in the Great Salt Lake valley than on the Atlantic coast; it rarely falls below zero. There is but little rain, except on the mountains, from March to October.

There were in this territory, in 1850, 16,333 acres of land improved, and 30,516 of unimproved in farms; cash value of farms \$311,799, and the value of implements and machinery \$84,288. Live stock—horses, 2429; asses and mules, 325; milch cows, 4801; working oxen, 5269; other cattle, 2489; sheep, 3262; swine, 914; value of live stock, \$546,968.

Agricultural Products, etc.—Wheat, 107,702 bushels produced; rye, 210; Indian corn, 9899; oats, 10,900; barley, 1799; buckwheat, 332; peas and beans, 239; potatoes, 43,968; sweet do. 60 bushels. Value of produce of market gardens, \$23,868; pounds of butter made, 83,309; of cheese, 30,998; molasses, 58 gallons; beeswax and honey, 10 lbs.; wool, lbs. produced, 9222; flax, 550; hops, 50; tobacco, 70; tons of hay, 4805; clover seeds, 2 bushels; flax-seed, 5; value of home-made manufactures, \$1392; of slaughtered animals, \$67,985.

The capital is Fillmore City, but the Great Salt Lake City is where the Legislature meets, and it is also the residence of the governor. The other towns are Palmyra, Springville, Provo, Cedar, Parowan, Manti, Lehi, Brownsville, etc.

Utah was a part of Alta California, which was ceded to the United States at the treaty of Guadalupe Hidalgo February, 1848. Previous to the Mexican war this territory was only known and occupied by trappers and Indians. About the time of the opening of the war, the Mormons were driven from Nauvoo, Illinois, and, after making a temporary sojourn at Council Bluffs, Iowa, they settled in Utah. They organized a government under the title of the State of Deseret, but the United States established a territorial government in 1850, by which the territory is nominally under subjection.

V.

Valonia, a species of acorn, forming a very considerable article of export from the Morea and the Levant. The more substance there is in the husk, or cup of the acorn, the better. It is of a bright drab color, which it preserves so long as it is kept dry: any dampness injures it, as it then turns black, and loses both its strength and value. It is principally used by tanners, and is always in demand. Though a very bulky article, it is uniformly bought and sold by weight. A ship can only take a small proportion of her registered tonnage of valonia, so that its freight per ton is always high.

Valparaiso, the principal sea-port of Chili, lat. (Fort St. Antonio) $33^{\circ} 1' 9''$ S., long. $71^{\circ} 41' 5''$ W. Population perhaps 28,000 or 30,000. The water in the bay is deep, and it affords secure anchorage, except during northerly gales, to the violence of which it is exposed; but as the holding ground is good, and the pull of the anchor against a steep hill, accidents seldom occur to ships properly found in anchors and cables. There is no mole or jetty; but the water close to the shore is so deep, that it is customary for the smaller class of vessels to carry out an anchor to the northward, and to moor the ship with the stern ashore by another cable made fast to the shore. Large ships lie a little farther off, and load and unload by means of lighters. The best shelter is in that part called the Fisherman's Bay, lying between the castle and fort St. Antonio, where, close to a clear shingle beach, there is 9 fathoms water. In the very worst weather a landing may be effected in this part of the bay.—See *MIRER's Chili and La Plata*, i. 440, where there is a plan of Valparaiso. The harbors of Valdivia and Concepcion are much superior to that of Valparaiso; the former being, indeed, not only the best in Chili, but second to few in any part of the world. But Valparaiso, being near the capital, Santiago, and being the central depot for the resources of the province, is most frequented. The town is conveniently situated, at the extremity of a mountainous ridge; most part of the houses being built either upon its acclivity or in its breaches. Large quantities of corn and other articles of provision are shipped here for Callao and San Francisco, but principally for the latter.

In Valparaiso, the phenomenon of the sea-breeze is finely developed. Valparaiso is situated near the southern border of the calm belt of Capricorn when it is at its farthest southern reach, which happens in our late winter and early spring—the Southern summer and autumn. This is the dry season, when the sky is singularly clear and bright. The atmosphere, being nearly in a state of equilibrium, is then ready to obey even the most feeble impulse, and to hasten toward the place of any, the slightest rarefaction.

At about ten in the morning the land begins to feel the sun, and there is a movement in the air. By 3 or 4 P.M., the sea-breeze comes rushing in from the southward and westward, and strikes the shipping in the harbor with the force of a gale. Vessels sometimes drag before it, and communication with the shore is suspended. By 6 P.M., however, the wind has spent its fury, and there is a perfect calm.—*MAURY's Phys. Geography*.

United States.—The United States has ranked next after England and France in the foreign trade of Chili; but, since the incorporation of California as a State of the American Union, the first rank in this trade is now assigned to the United States flag. This trade consists in the exportation of cotton textiles, flour, salted provisions, and miscellaneous cargoes. The article of cotton manufacture called *twecoyos* is much demanded in Chili, and, until lately, imported from the manufactories of England exclusively, is now supplied by the

United States, and constitutes a leading article of trade. Besides these countries, Chili has also considerable trade with several other European and South American nations. From Belgium she receives cigars, refined sugar, woolens, window-glass, gin, cheese, paper, and books; from Central America, bastard pearls, hides, indigo, cochineal, sugar, sarsaparilla, dye-woods, cotton, and coffee; for which she sends in return, from the warehouses of Valparaiso, textiles of cotton calicoes. Brazil sends no vessels to the ports of Chili; but there is some trade carried on between the two countries under the Chilian and foreign flag. Neither has Mexico any direct trade with Chili; but Hamburgian and English vessels annually supply the port of Mazatlan with valuable cargoes of European merchandise taken on board at Valparaiso. Owing to the restrictive character of Mexican commercial regulations, this trade is mostly contraband. Valparaiso is the chief port of transit for the commerce of all the republics of South America. The manufacturing industry of the southern provinces of Chili has made but little progress. There is but one establishment worthy of being specially noticed—namely, a copper foundry, which at the commencement of 1846 was in active operation; and from which that year were exported to foreign countries 4000 quintals of its productions. The ore was supplied from the ports in the northern parts of the republic, and even from the Bolivian port of Cobija. Chili is, however, essentially an agricultural country. Independently of the working of the mines of gold, silver, and copper, and the casting of these metals, almost all the mechanical industry of the republic is to be found in the flour-mills, the tanneries and currying establishments, and the tailoring shops, where the *ponchos* or *mangos* are made. There are, besides these, some establishments for the manufacture of candles and common soap. Still, there is but little probability that the manufacturing industry of Chili, at least for a great many years to come, will present any competition with the manufactured productions imported from Europe and the United States. The revenues of Chili have augmented in a ratio equal to the increase of its commercial prosperity. Its foreign debt is yearly curtailed, and the interest on it paid with such punctuality as to have raised the 6 per cent. stock in London to 108. This debt, contracted during the war of Independence, consisted originally of a loan raised in England of £1,000,000. Owing to civil wars, and the generally unsettled state of the country, the debt, with the accruing interest, soon doubled itself. Under the administration of Secretary Rengifo (in 1830), a compromise was effected with the English creditors, and its terms have since been faithfully adhered to. In 1852 this debt was reduced to \$7,104,000—one half at 6 per cent., and the remainder at 3. The home debt has been reduced to less than \$1,500,000, bearing 3 per cent. interest. The merchant marine of Chili has also shared in the general prosperity of the republic. Steam-vessels can at all times obtain coal in the greatest abundance, and of an excellent quality, from the mines of Talcahuano, and at many points along the coast. With such advantages for the active development of her physical and commercial resources, Chili has long since drawn to her ports the merchants of the great industrial and commercial nations of the world. Among these, England, France, Germany, and the United States, are the chief competitors for her foreign trade.

The revenues derived from import duties in 1851 amounted to \$2,724,718, of which there was collected at the port of Valparaiso \$2,426,631. The total amount in 1852 was \$3,465,038 77. The following table exhibits the quantities and values of copper, in bars, ex-

ported from Chili to the United States, from 1850 to 1855, both inclusive:

Years.	Value.
1850.....	\$1,008,044
1851.....	1,367,191
1852.....	1,294,481
1853.....	1,247,311
1854.....	1,367,206
1855.....	1,893,434

In 1852 the imports into Chili reached in value \$15,347,332; and the exports from Chili amounted to \$14,087,566. Compared with the preceding year, imports fell off \$537,640, while the exports of 1852 show an increase over those of 1851 of \$1,941,227. This perceptible advance in the export trade of Chili in 1852 is attributed to the increased activity in working the copper mines of Coquimbo and the silver mines of Copiapo, as also to several heavy shipments of flour and other products to California.

The following tabular statement exhibits the number of foreign vessels and their tonnage, and the number of national vessels, that entered Chilean ports from 1844 to 1851, both inclusive:

Years.	Foreign Vessels.	Tonnage.	Chilian Vessels.
1844.....	1487	374,028	1429
1845.....	1452	369,850	1486
1846.....	1523	388,557	1529
1847.....	1434	360,097	1521
1848.....	1397	343,456	1523
1849.....	1777	503,259	1541
1850.....	2599	740,425	1784
1851.....	2351	686,185	899

The number of vessels that cleared in 1850 was 2497, making an aggregate of (entered and cleared) 5096 vessels, with an aggregate tonnage of 1,442,425 tons. The number cleared in 1851 was 2205, which, with the 2351 given in the table, makes a total of 4556 vessels, measuring in all 1,233,978 tons. This shows a falling off in 1851 of 540 vessels, and 208,447 tons. It will be perceived that the number of national vessels that entered Chilean ports in 1851 is put down in the table at 899. It must not, however, be inferred from this that the merchant marine of Chili actually counts that number of vessels. The figures merely indicate the number of times the national merchant flag entered Chilean ports during the year. Still, within the past few years the merchant marine of Chili has largely increased. Starting from 1848, this increase is found to be—of vessels, 100 per cent., and of tonnage over 300 per cent. This is shown by the following statement:

Years.	No. of Vessels.	Aggregate Tonnage.
1848.....	105	12,628
1849.....	119	20,022
1850.....	153	27,601
1851.....	182	34,511
1852.....	215	41,509

An official dispatch to the British government from Chili, under date of September 13, 1855, states that the returns of Chilean trade for 1853 and 1854 shows a great increase in both branches of import and export; but that the markets were considerably affected by the high price of provisions, which commenced in 1854, and continued up to the date of the dispatch; owing mainly to the large exportation of wheat to Australia, where it brought as high as \$36 per quarter of eight bushels. Wool may be said to be, after copper, the chief article of import into the United States from Chili. The following tabular statement exhibits the quantities and values of wool imported into the United States from Chili, during the five years ending with June 30, 1855, together with the aggregate quantities and values of the same imported from all other countries for the same period—as given by United States authorities:

Years.	From all Countries.	Values.	From Chili.	Values.
	Pounds.		Pounds.	
1851.....	32,548,491	\$3,833,157	2,109,846	\$125,650
1852.....	18,341,298	1,930,711	1,863,189	169,616
1853.....	21,695,079	2,669,718	2,664,300	255,196

In 1843 a decree was passed by the Chilean government providing for the establishment of a statistical board. Since that period full commercial returns have been regularly published, under the title of *Estadística Comercial de la Republica de Chile*. From these publications the following tables, exhibiting the general foreign commercial movements of Chili, from 1844 to 1851, have been compiled:

TABULAR COMPARATIVE STATEMENT EXHIBITING THE FOREIGN IMPORT AND EXPORT TRADE OF CHILI, THE PRINCIPAL COUNTRIES PARTICIPATING THEREIN, AND THE SHARE ASSIGNED TO EACH, IN 1851, AND ALSO THE TOTAL TRADE FOR A PERIOD OF EIGHT YEARS.

Countries.	Imports.	Exports.

The principal ports of Chili open to general foreign trade are Valparaiso, Coquimbo, Huasco, Copiabo, Talcahuano, Constitucion, Valdivia, and Ancud. Vessels from abroad, entering any other than open ports, are liable to seizure. Under the Chilean commercial regulations, the coasting trade is prohibited to foreign vessels; but they may discharge portions of their original cargoes in one or more ports, and load Chilean produce for a foreign port. The port charges are as follows: Tonnage dues, 25 cents per ton; light dues (where light-houses exist), $3\frac{1}{2}$ cents per ton; roll and captain of the port's fees, \$4; harbor-master's fees, \$8. National or foreign vessels of war, national or foreign steamers, whale-ships, vessels in distress, or in ballast, or discharging under twenty packages, are exempt from tonnage and light dues. When tonnage dues have been paid at one port, they are not levied in another.

Commercial relations between the United States and Chili are regulated by the treaty of May 16, 1832—ratifications having been exchanged and proclamation made April 29, 1834. This treaty establishes the principle of "the most favored nation," and contains, besides, a stipulation providing that "free ships make free goods," and the usual guarantees for commercial reciprocity. The duration of the treaty was limited to twelve years; but, by virtue of the twelve-months' notice clause, it is still in force. Subsequent and recent commercial legislation of the Chilean government has modified and enlarged the provisions of the treaty of 1834. The principle of "the most favored nation" is but another name for differential duties between the national flag and that of the country with which such treaty is negotiated. These differential duties have been defined by Chili in a law bearing date January 8, 1834, and by various subsequent enactments. Such duties, however, have been suppressed, under certain limitations, chiefly by a law of July 16, 1850. The following is a translation of this law, so far as it relates to this subject:

Art. 1. Are suppressed, and of no force, articles 15, 16, 17, and 18 of the law of importation of the 8th January, 1834. The law defining differential duties. Is also suppressed that section of the law of August 7, 1834, by virtue of which national vessels were exempted from tonnage duties, such vessels hereafter being subjected to the same duties as foreign vessels. 2. The products of the soil and industry, and, in general, articles of commerce imported into Chili for consumption, in bottoms under a foreign flag, shall pay only the same duties as if imported under the national flag. 3. Articles of commerce imported into the republic in vessels of any nation that shall not have accepted the conditions of reciprocity established by the present law, will be subject to a surcharge, or extra duty, equal

to that imposed by such nation on merchandise brought into its ports in Chilean vessels. 4. To give effect to the foregoing article, the President of the republic shall fix the amount of differential duties authorized by the foregoing article.

Several decrees have been since issued regulating the amount of these differential or countervailing duties. Their principal points are: 1. Vessels of nations that have not accepted the reciprocity law of July 16, 1850, shall pay, instead of 25 cents per ton of the vessels' measurement, 75 cents per ton. 2. Merchandise imported in such vessels shall pay, in addition to existing duties, an additional duty of 6 per cent. *ad valorem*. The President of the United States, by his proclamation bearing date November 1, 1850, accepted the reciprocity granted in the above-recited law and decrees, and all restrictions and discriminations in the commercial relations of the two countries have ceased since that period.

The customs rates of the tariff of Chili are *ad valorem* on a fixed valuation of the articles of merchandise. By the 8th chapter, articles 2, 3, and 4, of the Chilean custom-house ordinance, it is provided that the tariff of values shall be adjusted by a commission of from five to nine merchants and custom-house officials at Valparaiso, subject to the approval of the government, and the values thus fixed shall be in force one year without change.—See CHILI.

Value. The exchangeable value of commodities, depends, at any given period, partly on the comparative facility of their production, and partly on the relation of the supply and demand. If any two or more commodities respectively required the same outlay of capital and labor to bring them to market, and if the supply of each were adjusted exactly according to the effectual demand; that is, were they all in sufficient abundance, and no more, to supply the wants of those able and willing to pay the outlay upon them and the ordinary rate of profit at the time, they would each bring the same price, or be exchanged for the same quantity of any other commodity. But if any single commodity should happen to require more or less capital and labor for its production, while the quantity required to produce the others continued stationary, its value, as compared with them, would in the first case rise, and in the second fall; and, supposing the cost of its production not to vary, its value might be increased by a falling off in the supply, or by an increase of demand, and conversely. But it is of importance to bear in mind that all variations in price arising from any disproportion in the supply and demand of such commodities as may be freely produced in indefinite quantities are temporary only; while those that are occasioned by change in the cost of their production are permanent, at least as much so as the cause in which they originate. A general mourning occasions a transient rise in the price of black cloth; but, supposing that the fashion of wearing black were to continue, its price would not permanently vary; for those who previously manufactured blue and brown cloths, etc., would henceforth manufacture only black cloth; and, the supply being this way increased to the same extent as the demand, the price would settle at its old level. When the price of a freely produced commodity rises or falls, such variation may evidently be occasioned either by something affecting the commodity, or by something affecting the value of money. But when, instead of being confined to one, the generality of commodities rise or fall, the fair presumption is that the change is not in them, but in the money with which they are compared. Exclusive, however, of the commodities now alluded to, there is a considerable class whose producers or holders either enjoy an absolute or a partial monopoly of the supply. When such is the case, prices depend entirely or principally on the proportion between the supply and demand, and are not liable to be influenced, or only in a secondary degree, by changes in the cost of production.

Prices have been often affected by variations in the cost and supply of gold and silver, whether arising from the exhaustion of old, or the discovery of new mines, improvements in the art of mining, changes of fashion, etc. Hence it is that tables of the prices of commodities, extending for a considerable period, communicate far less solid information than is generally supposed, and, unless the necessary allowances be made, may lead to the most unfounded conclusions. The real value of any commodity depends on the quantity of labor required for its production; but supposing that we were to set about inferring this real value, or the ultimate sacrifice required to obtain the commodity, from its price, it might happen (had the quantity of labor required for its production declined, but in a less degree than the quantity required to produce gold and silver), when its value would appear to rise when it had really diminished. When, however, the rate of wages, as well as the price of commodities, is given upon authentic data, a table of prices is valuable, inasmuch as it shows the extent of the command over the necessities and conveniences of life enjoyed by the bulk of the community during the period through which it extends. Those desirous of detailed information as to the prices of commodities in Great Britain in distant times, may consult the elaborate tables in the third volume of Sir F. M. EDEN's *Work on the Poor*, and the fourth volume of MACPHERSON's *Annals of Commerce*. ARBUTHNOT's *Tables of Ancient Coins, Weights, Measures, Prices*, etc., are well known, but the statements are not much to be depended upon. The *Traité de Metrologie* of M. PAUCOT (4to, Paris, 1780) is the best work on this curious and difficult subject. See also TOOKE's *History of Prices*, vols. i.-vi., which is the most complete history of prices extant.—See *articles COMMERCE, GOLD, MONEY, PRICES*, etc.

Vancouver (or, more properly, **Quadra and Vancouver**) **Island**, British North America, between lat. 48° 20' and 51° N., and long. 123° and 128° W., separated from the main land by Queen Charlotte Sound and the Gulf of Georgia. Length, northwest to southeast, 300 miles; greatest breadth, 75 miles. Estimated area, 16,000 square miles; and population, 11,463. Surface mountainous, and richly wooded. On its west coast are Nootka Sound, and many other harbors. This land was named in honor of George Vancouver. This British navigator was born about 1750. He served as midshipman under Captain Cook, in his second and third voyages. In 1790 he was appointed to command the expedition to explore the western coast of North America, to ascertain whether any navigable communication existed between the Atlantic and Pacific oceans. Of this voyage, which occupied from 1790 to 1795, he compiled an account, but died before its entire completion, May 10, 1798. The island is intersected by high mountain ranges, but it has, notwithstanding, a considerable extent of level and undulating land susceptible of cultivation. Soils very various, being principally, however, of a friable description. The best is a black vegetable mould, producing a most luxuriant vegetation. Climate peculiarly mild; but in winter the rains, accompanied with violent thunder-storms, are heavy, and almost incessant. The bays, rivers, and adjacent seas, swarm with a variety of fish, including salmon, sturgeon, herrings, etc., with seals, sea-otters, tortoises, etc., and they are also resorted to by whales. The harbors of the island are consequently well situated for carrying on an extensive and profitable fishery, and well fitted for ship-building. The mineral riches of the island have been very imperfectly explored. Beds of coal are to be met with in its northeast parts. In various localities the beds have been found cropping out at the surface, and large supplies have been obtained with but little difficulty and little expense. The native inhabitants subsist principally by hunting and fishing, especially the latter, and by cultivating the potato.

They are remarkable for indolence and filth; their heads are flattened when young by artificial means; and their legs are ill formed, those of the women being frequently swollen. A settlement established by the English at Nootka Sound in 1788 was suppressed in the following year by the Spaniards, an outrage which nearly occasioned a war with Spain. Since then it has been almost wholly neglected, till within these few years that some establishments have been formed upon it by the Hudson's Bay Company. Latterly it has been proposed to make it the site of a colony that should prosecute the seal and whale fishery, for which, as already stated, it is supposed to be peculiarly well situated; and, with a view to the realizing of this project, it has been made over to the Hudson's Bay Company, on condition of their establishing a colony within its limits in the course of the five years following 1848. Coal is procured at the settlement of Nanaimo, where the Hudson's Bay Company have made a large purchase of land and commenced an extensive coal work. Two valuable beds of coal, varying from five to seven feet in thickness, are found within 100 feet of the surface; the coal is bituminous, and is greatly prized for domestic consumption and for steaming purposes. The produce of these works may be increased, by increasing the number of hands, to any desirable extent. Another source of wealth and enterprise may be found in the magnificent ship spars produced on Vancouver's Island, which, in point of size and comparative strength, are probably the most valuable in the world, and may be procured in any number, even were the demand to include the supply of spars for the whole British navy. The oil exported from this colony is procured from the native tribes inhabiting the west coast of Vancouver's Island, and is manufactured by them from the whale and dog-fish; it is of excellent quality, and has a high character in California, where it brings from two to three dollars a gallon, in consequence of its retaining its fluidity and burning freely in the coldest weather. It is estimated that a quantity equal to 10,000 gallons was purchased from the natives of the west coast last year; and, considering the imperfect means they possess for taking the fish and trying out the oil, it is not unreasonable to propose that with the use of proper means the returns of oil would be greatly increased. The oil trade is carried on by a few enterprising individuals who live among the Indians, and collect the article as it is manufactured by the natives. The number of ships with cargoes which between July 5, 1854, and July 5, 1855, entered inward was 25; tonnage, 4054. In ballast, 3; tonnage, 260. Cleared outward with cargoes, 16; tonnage, 2350. In ballast, 9; tonnage, 1853. Port Victoria has five vessels belonging to it, and Vancouver's Island is a rising and flourishing little colony, all the more to be cherished as its people seem to be on good terms with the natives and encourage them in industrial pursuits.

Van Diemen's Land, or **Tasmania**, a large island belonging to Great Britain, forming part of Australia, lying between lat. 41° 20' and 43° 30' S., and long. 144° 40' and 148° 20' W. It is supposed to contain about 27,000 square miles. This land was discovered by the Dutch navigator Tasman in 1642, and was named in honor of Anthony Van Diemen, at that time governor-general of the Dutch possessions in the East Indies; but it is now frequently called Tasmania, from its discoverer. Previously to 1798, it was supposed to form part of New Holland, but it was then ascertained to be an island. It was taken possession of by the British in 1803; and in 1804 Hobart Town, the capital, was founded. The surface is generally hilly and mountainous; but though none of the land be of the first quality, there are several moderately fertile plains, and a good deal of the hilly ground is susceptible of being cultivated. On the whole, however, it is not supposed that more than about a third

part of the entire surface of the island can be considered arable; but about a third more may be advantageously used as sheep pasture. As compared with New Holland, it is well watered. The climate, though variable, is, generally speaking, good, and suitable for European constitutions; and it is not exposed to the tremendous droughts that occasion so much mischief in New South Wales. Wheat is raised in considerable quantities; though wool is at present the staple produce of the colony. Van Diemen's Land, like New South Wales, was originally intended to serve as a penal colony, and it received between 1823 and 1850 no fewer than 58,243 convicts. It has also received, especially of late years, large numbers of free settlers. In 1850 the total population of the island, exclusive of aborigines, who perhaps do not exceed 3000 or 4000, amounted to 70,194. Of these, 45,916 were free, and 24,188 convicts. For some considerable time back

great dissatisfaction was felt by the colonists at the continued importation of convicts; and latterly very vigorous measures were taken to effect its suppression. For this purpose it was in 1852-'53 finally abandoned. In truth, after the discovery of the gold-fields in the adjoining continent, it could no longer be continued.

Trade of Van Diemen's Land.—Hardware, haberdashery, apparel, cotton and linen goods, woolens, malt liquor, spirits, wine, etc., form the principal articles of import. Here, as in New South Wales, wool forms by far the most important article of export; next to it is whale-oil, and then follows wheat and flour, live stock, timber, whalebone, mimosa bark, and various less important articles. The usual excess of the imports over the exports is accounted for by the remittances to defray the cost of the convict establishment.

POPULATION, TRADE, ETC., OF VAN DIEMEN'S LAND FROM 1839 TO 1848, BOTH INCLUSIVE.

Years.	Population.	Value of Imports. £	Value of Exports. £	Shipping.		Total ordinary Revenue. £
				Inward. Tonnage.	Outward. Tonnage.	
1839.....	44,121	748,887	875,165	79,283	77,556	136,768

1848.....	70,194	594,164	490,281	91,883	95,988	129,545

The trade between the United States and Van Diemen's Land commenced in 1834, in which year our exports amounted to \$7120, and from that period up to 1847 averaged annually upward of \$20,000; while our imports from that colony during the same period did not exceed an annual average amount of \$7000.—See article AUSTRALIA.

Vanilla, the fruit of the *Epidendrum vanilla*, a species of vine extensively cultivated in Mexico. It has a trailing stem, not unlike the common ivy, but not so woody, which attaches itself to any tree that grows near it. The Indians propagate it by planting cuttings at the foot of trees selected for that purpose. It rises to the height of eighteen or twenty feet; the flowers are of a greenish yellow color, mixed with white; the fruit is about eight or ten inches long, of a yellow color when gathered, but dark brown or black when imported into Europe; it is wrinkled on the outside, and full of a vast number of seeds like grains of sand, having, when properly prepared, a peculiar and delicious fragrance. It is principally used for mixing with and perfuming chocolate; and is, on that account, largely imported into Spain. Vanilla is principally gathered in the intendency of Vera Cruz, in Mexico, at Misantla, Colipa, Vacuatla, and other places. It is collected by the Indians, who sell it to the whites (*gente de razon*), who prepare it for market. They spread it to dry in the sun for some hours, then wrap it in woolen cloths to sweat. Like pepper, it changes its color in this operation—becoming almost black. It is finally dried by exposing it to the sun for a day. There are four varieties of vanilla, all differing in price and excellence; viz., the *vanilla fina*, the *zacate*, the *rezacate*, and the *vasura*. The best comes from the forests surrounding the village of Zentila, in the intendency of Oaxaca. According to Humboldt, the mean exportation of vanilla from Vera Cruz may amount to from 900 to 1000 millares, worth at Vera Cruz from 30,000 to 40,000 dollars. Vanilla is also imported from Brazil, but it is very inferior. The finest Mexican vanilla is extremely high priced.—See HUMBOLDT, *Nouvelle Espagne*; POINSETT'S *Notes on Mexico*.

Variation of the Compass, the angle which the magnetic needle makes with the plane of the true meridian. It is otherwise called the *declination*.—See COMPASS. For tables showing the variation in a great

number of places, and its progressive, annual, and diurnal changes, see BREWSTER'S *Treatise on Magnetism*, 1837, reprinted from the *Encyclopædia Britannica*.

Varnish (Fr. *Vernis*), a fluid which, when spread thin upon a solid surface, becomes dry, and forms a coating impervious to air and moisture. There are two kinds of varnish, namely, *spirit* and *oil varnishes*: rectified alcohol is used for the former; and for the latter fixed and volatile oils, or mixture of the two. The solid substances dissolved in the above menstrua, and which constitute what is termed the body of the varnish, are almost exclusively resinous, and are chiefly the following: 1. *Turpentine*, all the varieties of which are employed by the varnisher: they form an excellent body, and give strength and glossiness at a small expense; but they do not dry without other additions. 2. *Copal*, a peculiar resin, very difficult to dissolve, but forming a hard and durable ingredient. It is generally melted over a gentle fire previous to use. 3. *Lac*, which gives great toughness and hardness; but is often inadmissible, on account of its reddish-brown color. 4. *Mastic*, which yields a tough, hard, brilliant, and colorless varnish. 5. *Elemi*, a resin of a pale yellow green tint, and a valuable ingredient, on account of its toughness and durability. 6. *Sandarach*, a resin which imparts splendor, but which alone is not durable. 7. *Amber*, a valuable ingredient, on account of its hardness and durability; but difficult of transparent solution, and hence chiefly used in opaque varnishes. 8. *Benzoin*, added on account of its fragrance. 9. *Anime*, which gives brilliancy and some scent. 10. *Gamboge*, for yellow varnishes. 11. *Dragon's blood*, for red varnish. These, together with turmeric, saffron, and annotta, are chiefly used on account of their color, and to cover brass and copper under the name of *lacquers*. 12. *Cucutcheon*: this extraordinary vegetable product has of late been much employed in a variety of preparations used as varnishes. It is invaluable where materials are to be rendered air-tight, as balloons, for example, and where at the same time flexibility, and even elasticity, are required; but its principal application in this way is in the manufacture of various *water-proof* articles. 13. *Asphaltum*, the varieties of which are indispensable in black oil varnishes. In making spirit varnishes, the strongest alcohol of commerce should be used (of a specific gravity not exceed-

ing 820), and its solvent power over some of the more intractable resins is sometimes improved by the addition of a little camphor. In order to prevent the agglutination of the resin, it is often requisite to mix it with sand or pounded glass, by which the surface is much increased, and the solvent energy of the spirit facilitated. The proportions in which the several ingredients are used, and the selections for particular purposes, are infinitely various. The following are a few good varnishes, in illustration of their varieties: 1. *Spirit Varnish*.—Sandarach 4 oz., seed lac 2 oz., elemi 1 oz.; digest the whole in a quart of moderately warm alcohol, and when dissolved add Venice turpentine 2 oz. 2. *Lac Varnish*.—Seed lac 8 oz.; digest for four days in a warm place with a quart of alcohol, and then strain through flannel. 3. *Turpentine Varnish*.—Mastic 12 oz., mixed with 5 oz. of pounded glass, and digested in a quart of oil of turpentine, adding at intervals about half an ounce of camphor in small pieces. When the mastic is dissolved, add to the warm fluid an ounce and a half of previously liquefied Venice turpentine, and stir the whole together. 4. *Copal Varnish*.—Copal which has been previously melted by gentle heat 3 oz., oil of turpentine 20 oz. (measure); put the oil into a flask placed in boiling water, and add the powdered copal in small portions at a time, so that it may be gradually dissolved; let it stand a few days to clear, and then pour it off, and if too thick for use, add to it a little warm oil of turpentine. This varnish dries slowly, but is very durable.—See article PAINTS.

Vellum, a species of fine parchment.—See PARCHMENT.

Velvet, a rich kind of stuff all silk, covered on the outside with a close, short, fine, soft shag, the other side being a very strong, close tissue. The nap or shag, called also the *velveting* of this stuff, is formed of part of the threads of the warp, which the workman puts on a long narrow-channelled ruler or needle, which he afterward cuts by drawing a sharp steel tool along the channel of the needle to the ends of the warp. Florence, Genoa, and some other cities of Italy, are most noted for the manufacture of velvet. There are cotton velvets manufactured in imitation of the silk ones in England.

Venezuela, a republic of South America; its territory lies chiefly between lat. 2° and 12° N., and long. 60° and 73° W., having on the east British Guiana, on the south Brazil, on the west New Granada, and on the north the Caribbean Sea. The chief wealth of Venezuela consists in its rich and extensive pastures, its mines of the precious metals, and of lead, iron, copper, etc., and its valuable forest timber. The agricultural and other products of the country which enter into its foreign commerce as articles of export are coffee, cocoa, cured hides, indigo, fustic, tobacco, cotton, cattle, mules and horses, and specie. These form the basis of the foreign commerce of Venezuela, and are exchanged for tissues of cotton, thread, silk, and wool; flour, provisions, hardware, soap, furniture, glassware, brandies, wines, etc. Conformably to the law of May 5, 1849, the ports open to foreign commerce are divided into three classes, namely: ports open for importation and exportation; ports open for importation for local consumption only, and for exportation; ports open for exportation only. This organization was simplified by a decree of April 15, 1854, of which the following is a translation:

Ciudad Bolívar, in the province of Guiana; La Guayra, in that of Caraccas; Puerto Cabello, in that of Carabobo; La Vela, in that of Coro; Maracaibo and Barcelona, in the two provinces bearing those names, are declared ports open to commerce, both for importation and exportation, without any restriction. Cumana, Carupano, Cariacito, and Barrancas, in the province of Cumana; Pampatar and Juan Griego, in the province of Margarita; Soledad, in the province of Barcelona; and Cumarebo, in that of Coro, are declared ports open to commerce for importation for local

consumption only, and for exportation. The custom-houses of the ports open for importation for local consumption only can not clear, under a certificate, foreign produce for other ports, open or not to commerce, except the custom-houses of Cumana, Carupano, and Cariacito, which are allowed to deliver cockets (certificates of cargo), the two former for the ports of Cariaco and Rio Caribe, the others for the ports of Irapa and Yaguarapara.

In the year 1803 the exports of Venezuela were estimated at a value of nearly \$7,000,000; of this amount La Guayra exported \$2,500,000, Cumana and Barcelona \$1,500,000, Maracaibo and Angostura \$1,000,000, Carupano and the smaller ports the remainder. These amounts are in Venezuelan currency—in which all values, derived from Venezuelan official sources, are generally stated. The dollar of the United States is equivalent in value to \$1 3½ in the present currency of Venezuela. The dollar of Mexico, Peru, Chili, Central America, and of Cuba, is that of the United States.

Internal Commerce.—The River Orinoco is now navigated as high up as Nutrias, in the province of Varinas; and the productions of the fertile countries watered by this magnificent river are thus added to the commercial wealth of the republic. A recent communication from Puerto Cabello affords the following facts: "Several mercantile firms of Puerto Cabello have applied for and obtained from the Congress of Venezuela a charter for a railroad to run nearly west from that city—54 miles—to San Felipe, in the province of Barquisimeto. The estimated cost is \$1,400,000 (United States currency), exclusive of land, which, for the most part, will be afforded free of expense. The government gives all the public land and timber which may be required, either for the road or buildings, and admits the tools, iron, etc., free of duty; subscribes for \$186,916 of the stock (\$250,000 in Venezuelan currency). The provinces of Barquisimeto and Corabobo together take \$67,290 of the stock. Of the grades, 70 per cent. will be below 80 feet to the mile, and only 5 per cent. above 50 feet. There will be 15 bridges, estimated to cost \$104,590. The charter is to continue 40 years as an exclusive privilege, and 40 years more the right of property in the road is guaranteed to the company; after which it reverts to the government. The road must be commenced within two years from 1st July, 1855, and be completed within four years from the date of its commencement. John Dougherty, of New York, chief engineer of the road, estimates the annual net income at \$242,222. San Felipe is situated on the Yariciu River, and is a commanding point for the collection of the products of the interior. Puerto Cabello is the best harbor in Venezuela."

The provinces of Varinas, Apure, and the two Guianas, are now brought into direct communication with the sea; and by the establishment, in 1845, of a line of steamers under the auspices of a company from the United States, specially chartered by the Venezuelan government, and by means of the 240 sailing vessels, with a capacity of 36,000 tons, which annually ascend as high as Angostura (Ciudad Bolívar), some 250 miles from the sea, there is but little room to doubt that Venezuela is about to enter upon a career of commercial prosperity. At present, the annual exports from Apure and Varinas consist of dry hides (about 100,000), buckskins, coffee, cotton, indigo, cocoa; and from the latter province between 1,000,000 and 2,000,000 pounds of tobacco. The value of this trade to the United States will be perceived, when it is known that nearly all the hides offered in the Venezuelan markets are taken by this country.

The value of the total trade of Venezuela for the fiscal year ending June 30, 1845, has already been given. For the year ending December 31, 1845, it reached a total of \$8,021,040, and the navigation employed 3209 vessels, measuring in the aggregate 190,732 tons.

COMMERCE OF THE UNITED STATES WITH VENEZUELA, FROM OCTOBER 1, 1898, TO JULY 1, 1957.

During the same year there entered the different ports of Venezuela 262 vessels, measuring an aggregate of 11,608 tons; and there cleared 392 vessels; with an aggregate of 17,645 tons—all under the national flag. Of foreign vessels there entered 494 vessels, measuring in all 76,760 tons; and there cleared 743 vessels, with an aggregate of 98,152 tons—making a total of 1237 vessels, and an aggregate of 174,912 tons, under foreign flags.

The Culture and Exportation of Cotton.—Notwithstanding many portions of the republic of Venezuela are well adapted to the cultivation of the cotton-plant, this branch of industry has been gradually declining during the past ten years. This has been attributed principally to two causes: 1st. The want of roads, or other artificial means of transportation, which reduces the planters to the necessity of employing mules to convey their produce to market; thus absorbing all the profit which this branch of industry might otherwise realize. 2d. The superior inducements which the cultivation of coffee, cocoa, and other tropical produce offer, as respects the amount of labor bestowed on their

production, the expense of transportation to market, and the price which such produce usually commands. To these may be added the superior quality of these latter products, for which Venezuela has acquired a high reputation in the markets of the world.

All cotton textiles which are consumed in the republic are imported from foreign countries. From the 1st July, 1849, to the 30th June, 1850, the total value of cottons imported amounted to \$253,586, namely: in national vessels, \$26,464; and in foreign vessels, \$227,122. During the same period, the exports of raw cotton reached 660,117 lbs., valued at \$44,248, viz.: in national vessels, 95,200 lbs., valued at \$5810; and in foreign vessels, 564,917 lbs., valued at \$38,438. The ports from which raw cotton was exported in 1849-'50, together with the quantities exported during that period, were as follows:

Puerto Cabello.....	461,924 pounds.
Maturin.....	98,200 "
La Guayra.....	90,693 "
La Vela.....	4,500 "
Ciudad Bolivar.....	2,800 "
Rio Coribe.....	2,000 "

From the above it will be perceived that, out of the fifteen ports of Venezuela, no cotton was exported from nine; among them being two of the most important—Cumana and Maracaibo—although the provinces of Cumana and Maracaibo are not only very extensive, but eminently adapted to the cultivation of this article. The species of cotton cultivated in Venezuela is what is denominated the long staple (black seed) of Louisiana and Georgia, and was introduced from the United States.

Commercial Regulations.—All foreign nations enjoy equal commercial privileges in Venezuela. Treaties exist between the republic and most of the governments of Europe and America. That with the United States was ratified May 31, 1836, and was to continue in force twelve years, with the usual twelve months' notice after that period. Such notice not having been given by either party, its provisions still continue in force. This treaty guarantees entire reciprocity and perfect liberty of trade, direct and indirect, between the two republics; and stipulates that all favors to other nations in respect of commerce and navigation, granted by either party, shall immediately become common to the other. Under the provisions of this treaty, and the commercial legislation of Venezuela, United States vessels enjoy the same privileges, and are subject to the same restrictions, as those of all other nations. American trade, however, would, it is thought, rest upon a firmer basis, and might be greatly extended by a new treaty with that republic, better adapted to the exigencies of present commercial relations than

that of 1836, entered into in the very infancy, political as well as commercial, of Venezuela.

In 1840, four years after the ratification of this treaty, the United States exported to that country 20,034 barrels of flour, valued at \$147,304. In 1854 our exports of that article reached 40,097 barrels, valued at \$318,732; showing an increase in the quantity and value of that one article, which we exchanged for the hides, coffee, and indigo of Venezuela, of 100 per cent.

The hides imported into the United States in 1840 amounted in value to \$288,372. In 1854 they reached as high as \$1,623,695; showing an increase, in that single article of our imports, of over 400 per cent. A more liberal tariff of duties on our flour and cotton goods in the ports of Venezuela would continue to augment still more largely this growing trade. The justice of such a measure will be obvious when it is considered that the principal article which the United States import from Venezuela (hides) is subject in our ports to a duty of 5 per cent. only; while the principal article which we furnish in exchange (flour) is taxed in its ports with a duty of \$4 per barrel, which, at a value of from \$12 to \$16 per barrel (its average price in the Venezuelan markets), is equal to 25 @ 30½ per cent., besides sundry other duties which are superadded before the article can get into market. These facts are sufficiently suggestive without further comment. Duties are levied on a valuation basis, though many articles in the tariff are liable to specific duties. Instead of specifying each extra charge separately, these heavy imposts can be best illustrated by an actual case:

Custom duties on 100 barrels American flour landed at the port of La Guayra, at \$4 per barrel import duty	\$400 00
10 per cent. on amount of duties on account of late internal war	40 00
2 per cent. on amount of duties for wharfage	8 80
2 per cent. road tax	8 80
	\$457 60
20 per cent. on aggregate amount; contribution extraordinary	91 52
	\$549 12
½ per cent. for the new church on \$457 60	2 29
Total duties, extras, etc.	\$551 41

NAVIGATION DUES.

Tonnage duties	\$0 37½ per ton = \$0 25 (U. S. cur'y.)
Anchorage	18 " = 12 "
Water	12 " = 9 "
Light-house	6 " = 4 "
Entrance	7 " = 5 "
Clearance	2 00 " = 1 54 "
To captain of the port	3 00 " = 2 25 "
To health officer	3 00 " = 2 25 "
To interpreter	3 00 " = 2 25 "

The ton is Venezuelan measurement, generally 12½ per cent. more than that of the United States. The value of Venezuelan money differs considerably, as already noted, from that of the other South American states, though of the same denomination. The following are the legal values of some of the foreign coins in circulation in Venezuela, as fixed by the law of May 30, 1848:

One dollar of the United States equal to	\$1 34½
One dollar of Peru equal to	1 84½
One dollar of Mexico equal to	1 84½
Five-franc piece of France equal to	1 25
One shilling of Great Britain equal to	81½
One guinea of Great Britain equal to	6 50

—*Com. Rel. U. S.*

Articles noted free in the tariff pay, in lieu of all extras, 15 per cent. One of the greatest impediments heretofore existing to the increase of American trade with Venezuela was the restriction imposed on the transshipment of American merchandise imported expressly for the markets of New Granada. Some years since, Maracaibo was declared a place of deposit for such merchandise—a measure of the greatest importance to commerce, as nearly half the imports at that port are destined for San José de Cucuta, in New Granada. The privilege thus granted was subsequently rendered nu-

gatory by severe restrictions and onerous duties. A more liberal decree, however, has very lately been promulgated (August 10, 1855), which must necessarily largely augment the imports into Venezuela, and thus promote the general commerce of the republic.—*See articles CARACCAS and LA GUAYRA.*

Venice (It. *Venezia*; Ger. *Venedig*; ancient, *Venetia*), a fortified city of Austrian Italy, formerly the capital of the republic of that name, on a cluster of small islands toward the northern extremity of the Adriatic, in lat. 45° 25' 53" N., long. 12° 20' 31" E. Population in 1851 about 128,000. The commerce of Venice, once the most extensive of any European city, is now comparatively trifling; and the population is gradually diminishing both in numbers and in wealth. Her imports consist of wheat and other sorts of grain from the adjoining provinces of Lombardy and the Black Sea; olive-oil, principally from the Ionian Islands; cotton stuffs and hardware from England; sugar, coffee, and other colonial products from England, the United States, Brazil, etc.; dried fish, dye-stuffs, etc. The exports principally consist of grain, raw and wrought silk, silk goods, glass wares, books, paper, woolen manufactures, fruits, cheese, etc., the products of the adjoining provinces of Italy, and of her own industry; but her manufactures, so famous in the Middle Ages, are now much decayed. The origin of Venice dates from the period of the invasion of Attila in 452, when a number of the inhabitants of Venetia, and other parts of Italy, taking refuge in the islands of the Adriatic, formed a confederation to oppose the barbarians. In 697 they elected, as the head of their government, a doge or duke (*dux*).

The Venetian states formed themselves into a republic in 809. In 997 they took possession of the town of Narenta, a nest of pirates, and thus commenced their maritime power; they afterward subjugated all the towns of Dalmatia. The crusades were a source of aggrandizement for Venice. At the end of the 12th century, the Venetians made themselves masters of part of the Morea, Corfu, Cephalonia, and Crete. During two centuries they monopolized the commerce of India by the route of Egypt; but they lost this on the discovery of the passage by the Cape of Good Hope. The state attained the height of its prosperity in the 15th century. It began to decline at the beginning of the 16th century, and its overthrow was completed by the French in 1797. By the treaty of Presburg in 1805, it was made over, with the provinces of the continent, to the kingdom of Italy, and was held by the French till 1814, when it reverted to Austria. In 1848 the Venetians revolted against the Austrians, and held the city for several months. The government of Venice comprises eight delegations, which bear the names of their capitals: Venice, Padua, Vicenza, Verona, Rovigo, Treviso, Belluno, and Udine. Population in 1850, 2,281,732; do. of provinces, 298,425. The Gulf of Venice is formed by the Adriatic, on the northeast coast of Italy, bounded by the Piave and Brenta.

Port.—The islands on which Venice is built lie within a line of long, low, narrow islands, running north and south, and inclosing what is termed the lagoon, or shallows, that surround the city, and separate it from the main land. The principal entrance from the sea to the lagoon is at Malamocco, about 1½ league south from the city; but there are other, though less frequented entrances, both to the south and the north of this one. There is a bar outside Malamocco, on which there are not more than 10 feet at high water at spring tides; but there is a channel between the western point of the bar and the village of San Pietro, which has 16 feet water at springs, and 14 at neaps. Merchant vessels usually moor off the ducal palace; but sometimes they come into the grand canal which intersects the city, and sometimes they moor in the wider channel of the Giudecca. Vessels coming from the south for the most part make Pirano or Rovigno, on the coast of Istria, where they take on board pilots, who carry them to the

bar opposite to Malamocco. But the employment of Istrian pilots is quite optional with the master, and is not, as is sometimes represented, a compulsory regulation. When one is taken, the usual fee from Pirano or Rovigno to the bar is 20 Austrian dollars. On arriving at the bar, ships are conducted across it and into port by pilots, whose duty it is to meet them outside, or on the bar, and of whose services they must avail themselves.

Money.—Formerly there were various methods of accounting here; but now accounts are kept, as at Genoa, in lire Italiane, divided into centesimi, or 100th parts. The lira is supposed to be of the same weight, fineness, and, consequently, value, as the franc. But the coins actually in circulation, denominated lire, are respectively equal in value to about ten cents. The latter are coined by the Austrian government.

Weights and Measures.—The commercial weights are here, as at Genoa, of two sorts: the *peso sottile* and the *peso grosso*. The French kilogram, called the *libra Italiana*, is also sometimes introduced.

100 pounds peso grosso	= 105.186 pounds avoirdupois.
"	= 127.830 pounds Troy.
"	= 47.698 kilograms.
"	= 98.435 pounds of Hamburg.
"	= 96.569 pounds of Amsterdam.
100 pounds peso sottile	= 66.428 pounds avoirdupois.
"	= 80.728 pounds Troy.
"	= 30.123 kilograms.
"	= 63.196 pounds of Hamburg.
"	= 60.986 pounds of Amsterdam.

The *moggio*, or measure for corn, is divided into 4 staja, 16 quarte, or 64 quartaroli. The staja = 2.27 bushels. The measure for wine, anfora = 4 bigonzi, or 8 mastelli, or 48 sechii, or 192 bozze, or 768 quartuzzi. It contains 137 English wine gallons. The botta = 5 bigonzi. Oil is sold by weight or measure. The botta contains 2 migliaje, or 80 miri of 25 lbs. peso grosso. The miro = 4.028 English wine gallons. The braccio for woolen = 26.6 English inches; the braccio for silks = 24.8 do. The foot of Venice = 13.68 English inches.

The foreign commerce of Venice in 1847 amounted in value to 36,500,000 francs. The revolutionary movements of 1848, the long siege which it endured, and the suspension of its privileges as a free port, completely paralyzed its commercial movements. In 1851 these privileges were restored, and the commerce of Venice has again resumed its wonted activity.

The imports into the port of Venice in the years 1847 and 1848 were:

1847.—Foreign imports	36,484,000 francs.
1848.—Foreign imports	3,322,000 "

IMPORTS AND EXPORTS TO AND FROM VENICE IN 1851 AND 1852.

Years.	Imports.	Exports.	Total Trade.
1851..... francs	25,800,800	6,754,100	32,554,400
1852..... "	35,798,700	14,206,300	50,005,000

It will thus be seen that the commercial movements of the port of Venice in 1852 exceeded in value the sum of 50,000,000 francs (nearly \$10,000,000), and show an increase over the totals of 1851 of 17,500,000 francs. This is to be attributed to the restoration of the commercial franchise of the port—an act of justice which was delayed until the operations of the second half year of 1851 had already commenced.

The following table exhibits the navigation of Venice during the two years under review:

1851.—Total vessels entered and cleared	1281, of 173,714 tons.
1852.—Total	" 1743, of 234,240 "

The following statement exhibits the imports and exports to and from Venice in 1853 compared with 1852:

Years.	Imports.	Exports.	Total Trade.
1853..... francs	38,798,700	15,604,700	54,403,400
1852..... "	35,798,700	14,206,300	50,005,000
Increase, 1853.	" 3,000,000	" 1,398,400	" 4,398,400

The coasting trade during the year 1853, added to the foregoing, figures a total of 20,544,400 francs, against 19,699,100 francs in 1852. Thus:

COASTING TRADE OF VENICE IN THE YEARS 1852 AND 1853.			
Years.	Imports.	Exports.	Total Trade.
1853..... francs	10,848,400	9,696,000	20,544,400
1852..... "	10,417,000	9,281,800	19,699,100
Increase, 1853.	" 431,100	" 414,200	" 845,300

The navigation of this port in 1853, compared with that of 1852, is thus given:

	Entered.		Cleared.	
	Vessels.	Tons.	Vessels.	Tons.
1852.....	942	135,462	801	98,778
1853.....	1025	139,253	949	127,262

During these years it appears that not a single American vessel entered that port, or cleared thence for the United States. This may seem strange when the eye is cast over the following list of leading articles imported into Venice in 1852:

	Francs.
Cereals.....	8,128,300
Olive-oil.....	4,491,400
Salted fish.....	4,471,500
Coal.....	3,780,000
Salt.....	2,490,900
Dried fruits.....	1,891,500
Twist (all kinds).....	1,959,200
Raw cotton.....	1,084,900
Wines and spirits.....	953,900
Iron and steel.....	861,200
Wax.....	704,900
Coffee and cocoa.....	427,900
Cheese.....	603,600
Sugar (brown and refined).....	1,484,600

From a consular return, dated Venice, April 24, 1856, it appears that there entered that port in November and December, 1855, two American vessels, measuring respectively 663 and 527 tons, having cleared from Richmond and bound to Palermo, after discharge of cargo, consisting of tobacco, valued at \$75,000. They left Venice for their destination in ballast. In January another American vessel, measuring 248 tons, entered in ballast, and cleared for Constantinople with a cargo of hay valued at \$2500.—*Com. Rel. U. S.*

Vera Cruz, the principal sea-port on the eastern coast of Mexico; lat. 19° 11' 52" N., long. 96° 8' 45" W. Population about 16,000. Opposite the town, at the distance of about 400 fathoms, is a small island on which is built the strong castle of San Juan d'Ulloa, which commands the town. The harbor lies between the town and the castle, and is exceedingly insecure; the anchorage being so very bad that no vessel is considered safe unless made fast to rings fixed for the purpose in the castle wall: nor is this always a sufficient protection from the fury of the northerly winds (*los nortes*), which sometimes blow with tremendous violence. Humboldt mentions, in proof of what is now stated, that a ship of the line, moored by nine cables to the castle, tore, during a tempest, the brass rings from the wall, and was dashed to pieces on the opposite shore.—*Nouvelle Espagne*, ed. 2de, iv. 59. Its extreme unhealthiness is, however, a more serious drawback upon Vera Cruz than the badness of its port. It is said to be the original seat of the yellow fever. The city is well built, and the streets clean; but it is surrounded by sand hills and ponds of stagnant water, which, within the tropics, are quite enough to generate disease. The inhabitants, and those accustomed to the climate, are not subject to this formidable disorder; but all strangers, even those from the Havana and the West India Islands, are liable to the infection. No precautions can prevent its attack; and many have died at Xalapa, on the road to Mexico, who merely passed through this pestilential spot. During the period that the foreign trade of Mexico was carried on exclusively by the *flota*, which sailed periodically from Cadiz, Vera Cruz was celebrated for its fair, held at the arrival of the ships. It was then crowded with dealers from Mexico and most parts of Spanish America; but the abolition of the system of regular fleets in 1778 proved fatal to this fair, as well as to the still more celebrated fair of Porto Bello. A light-house has been erected on the northwest angle of

the Castle of San Juan. The light, which is a revolving one of great power and brilliancy, is elevated 79 feet above the level of the sea.

For a considerable period after the town of Vera Cruz had thrown off the Spanish yoke, the Castle of San Juan d'Ulloa continued in possession of the Spaniards. During this interval the commerce of Vera Cruz was almost entirely transferred to the port of Alvarado, 12 leagues to the southeast. Alvarado is built upon the left bank of a river of the same name. The bar at the mouth of the river, about $1\frac{1}{2}$ mile below the town, renders it inaccessible for vessels drawing above 10 or 12 feet water. Large ships are obliged to anchor in the roads, where they are exposed to all the violence of the north winds, loading and unloading by means of lighters. Alvarado is supposed, but probably without much foundation, to be a little healthier than Vera Cruz. The trade has now mostly reverted to its old channel.

The commercial intercourse of the United States with Vera Cruz depends now solely on the regulations of the mother country (i. e., the capital). Local legislation has nothing to do with it, except as regards a few unimportant harbor dues, and municipal taxes imposed by the "ayuntamiento" (city council). The existing regulations are permanent in name, but may be regarded as temporary in fact, being liable to be changed at any moment by arbitrary decree, or utterly destroyed by "pronunciamiento." There are no privileges permitted the commerce of other nations which are denied to the United States, nor are there any restrictions imposed on the commerce of other nations and not on that of the United States. It is understood that the Danish commercial treaty is the least favorable to Mexico; but, practically, all nations may be regarded as on an equal footing. Mexico takes care to make no national distinctions, but she very frequently sells special privileges to individuals, as in the cases at San Blas, Mata-

moras, and Mazatlan. At Vera Cruz an immense amount of raw cotton is being imported from New Orleans, on the payment of about one half the duty indicated by the existing tariff—"permits" to import that article at a greatly reduced rate having been granted to favored individuals. The regular duty is three cents per pound, but permits can now be bought up at second hand at two cents per pound.

Verd [Cape] Islands. The Cape Verd Islands are situated 329 miles west of Cape Verd, between lat. $14^{\circ} 45'$ and $17^{\circ} 13' N.$, and long. $22^{\circ} 45'$ and $25^{\circ} 25' W.$ The Archipelago consists of the following ten islands: Sal, Boavista, Mayo, Santiago (St. James), the largest, Forgo, Brava, Grande, Rombo, St. Nicolão, and St. Luzia; and four islets, Branco, Razo, St. Vicente, and St. Antão. Area estimated at 1680 square miles. Population in 1850, 86,738. The white population in the whole Archipelago is to the colored as one to twenty. The surface of the islands is in general mountainous, and some of their peaks have a considerable elevation. The volcano of Pogo is 9157 feet in height. The soil is extremely various, but mostly fertile; the absence of trees and the scarcity of water are the causes of frequent and severe distress. Chief vegetable products, maize, rice, and French beans. Coffee, introduced in 1790, has completely succeeded; the cotton shrub is indigenous; indigo grows wild, and tobacco is cultivated in some of the islands; tropical fruits are abundant. The sugar-cane and the vine are cultivated, but the manufacture of wine is prohibited. The climate of these islands is much varied by extreme heats and droughts, no rain falling during some periods for three or four years. Hence the population are frequently subject to distress and suffering. These visitations have, on several occasions during the past few years, strongly appealed to the sympathies of the civilized nations of the world in behalf of the 87,000 inhabitants of these islands.—See article MEXICO.

COMMERCE OF THE UNITED STATES WITH THE CAPE DE VERD ISLANDS, FROM OCTOBER 1, 1820, TO JULY 1, 1857.

* Nine months to June 30, and the fiscal year from this time begins July 1.

In 1842 the imports from the United States amounted to \$57,500, employing 16 vessels with an aggregate tonnage of 1610 tons. An export duty of \$5 58 per pipe is levied on wine. The duties on the principal imports from the United States are as follows:

Flour, per barrel.....	\$1 00
Corn, per bushel.....	6½
Rice, per pound.....	1
Staves (pipe), per 1000.....	1 60
Staves (hoghead), per 1000.....	1 80
Staves (barrel), per 1000.....	75
Lumber, per 1000 feet.....	1 90

Port charges in Madeira amount to about \$18 on a vessel of any tonnage, for health officer, government visits, and custom-house fees.—*For WEIGHTS and MEASURES, see p. 1943.*

Verdigris (Ger. *Grünspan*; Fr. *Vert-de-gris*, *Verdet*; It. *Verderame*; Sp. *Cardenillo*, *Verdete*, *Verde-gris*; Russ. *Jar*), a kind of rust of copper, of a beautiful bluish green color, formed from the corrosion of copper by fermented vegetables.

Its specific gravity is 1.78. Its taste is disagreeably metallic, and, like all the compounds into which copper enters, it is poisonous. It was known to the ancients, and various ways of preparing it are described by Pliny. It is very extensively used by painters and in dyeing; it is also used to some extent in medicine. The best verdigris is made at Montpellier; the wines of Languedoc being particularly well suited for corroding copper, and forming this substance. It is generally exported in cakes of about 25 lbs. weight each. It is also manufactured in this country, by means of the refuse of cider, etc. The goodness of verdigris is judged of from the deepness and brightness of its color, its dryness, and its forming, when rubbed on the hand with a little water or saliva, smooth paste, free from grittiness.—*THOMSON'S Chemistry; REES' Cyclopædia.*

IMPORTS OF VERDIGRIS INTO THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1857.

Whence imported.	Pounds.	Value.
Hamburg.....	1,057	\$302
England.....	790	195
British American colonies.....	200	41
France.....	30,301	9097
Spain.....	220	55
Total.....	32,548	\$6,600

None of this was re-exported, so that the whole may be set down for home consumption.

Verjuice (Ger. *Agrest*; Fr. *Verjus*; It. *Agresto*; Sp. *Agraz*), a kind of harsh, austere vinegar, made of the expressed juice of the wild apple, or crab. The French give this name to unripe grapes, and to the sour liquor obtained from them.

Vermicelli (Ger. *Nudeln*; Du. *Meeleepen*, *Propen*; Fr. *Vermicelli*; It. *Vermicelli*, *Tagliolini*; Sp. *Aletrías*), a species of wheaten paste formed into long, slender, hollow tubes, or threads, used among us in soups, broths, etc.—*See MACARONI.*

Vermilion. *See CINNABAR.*

Vermont, one of the United States of America, lies between lat. 42° 44' and 45° 00' 30" N., and long. 73° 20' W., and contains an area of 8000 square miles. Population in 1790, 85,589; in 1800, 154,465; in 1810, 217,895; in 1820, 235,764; in 1840, 291,948; and in 1850, 313,611.

Physical Features, etc.—This State presents a very considerable variety of surface. It is traversed from north to south by the Green Mountain range, some summits of which rise to a height of 4279 feet above the sea. About the centre of the State they divide into two ridges, the principal of which passes in a north-northeast direction into Canada. The Green Mountains are from ten to fifteen miles wide, much intersected by valleys abounding with springs and brooks, and are mostly covered with evergreens to their summits, from which they have derived their name. The rivers are inconsiderable; most of those flowing east are merely small tributaries of the Connecticut; those on the west side are larger; and the three principal, viz.,

Lamoille, Missisquoi, and Winooski, rise on the east side of the principal mountain range, which they break through and enter Lake Champlain.

Lake Champlain, a considerable body of water between the States of New York and Vermont, and penetrating for a few miles into Canada. It is 140 miles in length, and from 1 to 10 in breadth, lying nearly north and south; and contains a great number of small islands, most of which belong to Vermont. The Champlain Canal, 63 miles in length, connects it with the Hudson, and large steamboats and vessels of 100 tons navigate the lake from end to end. The scenery along its shores is highly picturesque, and its waters abound in salmon, salmon-trout, sturgeon, and other fish. Lake Champlain is navigable for large vessels, and has several good harbors on the Vermont side. It is of the greatest importance to Vermont by giving her facilities for internal commerce. From the shape of the lake it gives the large amount of coast line and length of navigation, and makes up for the deficiency of navigable rivers. The American commerce of Lake Champlain in 1856 was over 20,000 tons. The climate varies according to differences of level and other circumstances. It is healthy, although the winters are severe. The soil is fertile, but more suitable for pasturage than tillage. Wool is the staple production; sheep, horses, and cattle are raised in great numbers; marble, granite, and slate are abundant, and valuable quarries of each are worked; iron ore abounds in several localities throughout the State, and from the sulphuret of iron, in Strafford and Shrewsbury, coppers are extensively manufactured. Several mineral springs occur.

There were in this State in 1850, 2,601,409 acres of land improved, and \$1,524,413 of unimproved in farms; cash value of farms, \$63,367,227, and the value of implements and machinery, \$2,739,282. *Live Stock.*—Horses, 61,057; asses and mules, 218; milch cows, 146,128; working oxen, 48,577; other cattle, 154,143; sheep, 1,014,122; swine, 66,296; value of live stock, \$12,643,228.

Agricultural Products, etc.—Wheat, 535,955 bushels; rye, 176,233; Indian corn, 2,032,396; oats, 2,307,784; barley, 42,150; buckwheat, 209,819; peas and beans, 104,649; potatoes, 4,951,014; value of products of the orchard, \$315,255; produce of market gardens, \$18,853; pounds of butter made, 12,137,980; of cheese, 8,720,834; maple-sugar, 6,349,357; molasses, 5997 gallons; beeswax and honey, 249,422 lbs.; wool, pounds produced, 3,400,717; flax, 20,852; silk cocoons, 268; hops, 288,023; tons of hay, 866,153; clover seeds, 760 bushels; other grass seeds, 14,936; flaxseed, 939 bushels; and were made 659 gallons of wine. Value of home-made manufactures, \$267,710; of slaughtered animals, \$1,861,336.

Manufactures, etc.—There were in the State in 1850, 11 cotton factories, with a capital invested of \$197,500, employing 123 males and 207 females, producing sheetings, etc., valued at 280,300; 96 woolen factories, with a capital of \$1,015,175, employing 800 males and 812 females, manufacturing 3,130,400 yards of cloth, valued at \$1,820,769; three establishments making pig-iron, with a capital of \$88,000, employing 133 persons, producing pig-iron, etc., valued at \$80,000; 26 establishments, with a capital of \$290,720, employing 331 persons, and making 5000 tons of castings, etc., valued at \$460,831; 8 establishments, with a capital of \$62,700, employing 57 persons, manufacturing 2045 tons of wrought iron, valued at \$163,986; 83 flouring and grist mills; 321 saw-mills; 156 tanneries, with a capital of \$411,150, employing 397 persons, valued at \$587,466; 30 printing-offices; 2 daily, 1 semi-weekly, 31 weekly, and 2 monthly publications. There were on the 1st January, 1856, 8 railroads, with 516 miles of road finished and in operation. Capital employed in manufactures, \$5,001,377; value of manufactured articles, \$8,570,920. The principal places in the State are Montpelier, the capital, Burlington, Middlebury, Brattleboro, Norwich, St. Albans, and Castleton.

FOREIGN COMMERCE OF THE STATE OF VERMONT, FROM OCTOBER 1, 1820, TO JULY 1, 1857, SHOWING ALSO THE DISTRICT TONNAGE IN 1821, 1831, 1841, AND 1851.

Years ending	Exports.			Imports.	Tonnage cleared.		District Tonnage.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Burlington, Vermont, is the principal port of the State. Its commerce by Lake Champlain, on a bay of which the town is built, is important, and its connections by railroad and steamboat afford it every facility in its prosecution. The harbor of Burlington is the best on the lake, and more vessels navigating the lake are owned here than at any other place. It is easy of access from the north and south, and to protect it from the west winds a breakwater 900 feet long was erected. Juniper Island is distant four miles from the wharf, and contains eleven acres of ground. A light-house was erected on this island in 1826; it is in the form of a truncated cone, thirty feet high, eighteen feet in diameter at the base, and twelve at the top, and is kept lighted at night during the season of navigation, from the middle of April to the 1st of December. Burlington has an extensive and fertile back country, and the mercantile business of the place amounts to about \$1,000,000 annually. Tonnage in 1853, 5875; in 1856 it was 7448 tons.

Vessels. See articles SHIPS and TONNAGE.

Victoria (formerly called **Australia Felix** and **Port Philip**), a British colonial territory, comprising all the part of Australia south of the rivers Murrumbidgee and Murray, between lat. 34° and 39° S., and long. 141° and 150° E., having on the northeast New South Wales, on the west the colony of South Australia, and on the south the ocean and Bass's Strait, separating it from Tasmania. Area, 98,000 square miles. Population in 1851, 77,345, of which 46,202 were males, and 31,143 females; in 1855, 800,000, and of these it is estimated that 5000 are aborigines. The territory derived its former name from the fine bay of Port Philip, near the centre of its coast line; besides which, here are the inlets Western Port, Corner Inlet, Lake King, Port Fairy, and Portland Bay, most of which afford good anchorage, and are the seats of in-

cient towns. Surface mostly undulating or level, separated into different river basins by hill chains. Temperature at Port Philip ranges from 32° to 90° in the year, and may average about 61° Fahr. Soil more fertile generally than in New South Wales, though around the borders are extensive tracts of barren land. For about 50 miles from the coast the country is almost every where of high fertility; there is also much good land on the banks of the Hume and Hovell; and although hitherto the corn raised has been inadequate for home consumption, and a supply has been imported from Tasmania, this colony bids fair to become a thriving agricultural region. Sheep and cattle rearing are, however, the principal occupations of the population, and in 1851 the live stock in the province amounted to 5,000,000 sheep, 16,500 horses, and 390,000 horned cattle. In the same year, 100 acres were planted with vines, and 1300 gallons of wine were made, chiefly near Geelong. Wheat, oats, barley, potatoes, salt from the lakes, pumice-stone, lava, and other volcanic products abundant in the western plains, are other chief articles of produce. Some veins of coal, and ores of copper, lead, and manganese, have been met with near the coast; but few, if any, mines are at present wrought. The principal towns are Melbourne and Geelong. The colony was formerly called Australia Felix, and was attached to New South Wales. It was formed into a distinct colony in 1850, under the name of the Province of Victoria. It was first settled by the British about 1834.

The commercial relations of the United States with the British possessions in Australia, New Zealand, and the Cape of Good Hope, are regulated by the orders of the local governments, within the limits prescribed to their authority by the legislation of the Imperial Parliament. The repeal of the British navigation laws abolished all the restrictions upon foreign commerce, which before that period secured to the British merchant the

monopoly of supplying the markets of these distant colonies. The trade is now open to all flags, and the vessels of every nation having commercial treaties with the mother country can freely and upon equal terms enter in the race of commercial competition. Co-operating with this liberal policy of the mother country, the discovery of gold in some of the Australian possessions in 1851 contributed largely to infuse new commercial life and vigor into that distant part of the globe. Some estimate may be formed as to the extent of the wonderful advance of these colonies in commercial and colonial greatness, the increase of their imports and exports, and the augmentation of their resources generally, by glancing over the subjoined statistics.

In 1843 the value of the imports of the colony of Victoria was \$1,229,840; that of their exports, \$1,539,830. Of this latter sum wool covered nearly \$1,000,000, all of which was shipped to Great Britain. Value of imports in 1847, \$2,188,480; of which \$1,592,120 were from Great Britain. Value of exports in 1847, \$3,342,555; of which wool covered \$2,829,025, distributing the balance (\$513,530) between the articles of beef, pork, horses, horned cattle, and tallow. Number of vessels in 1847, 423, with a tonnage of 47,885.

The following tables will exhibit the trade of the colony of Victoria from 1851 to the end of the first half of 1854:

	Imports.	Exports.
In the year 1851.....	\$4,379,140	\$4,181,210
" 1852.....	17,524,365	35,685,775
" 1853.....	70,473,235	45,412,870
In the half year of 1854.....	42,780,340	24,509,400

Amount of flour from the United States imported in 1853, 15,036 tons; and more than one half of the whole quantity imported. Amount imported from the United States in the half year of 1854, 3720 tons; or more than one-third of all imported.

The total exports from the United States to Australia for the year ending June 30, 1857, were as follows:

Boards.....	\$214,892	Tobacco.....	\$235,128
Manufac. of Wool.....	251,209	Boots and shoes.....	140,465
Bacon.....	111,088	Other articles.....	1,451,279
Flour.....	893,070	Total.....	\$3,297,181

AMERICAN VESSELS WHICH ARRIVED AT MELBOURNE FROM JANUARY, 1853, TO SEPTEMBER, 1854.

From New York.

Ships.....	52; average passage, 121 days.
Barks.....	22; " " 118 "
Brigs.....	2; " " 140 "
Schooners.....	7; " " 120 "

From Boston.

Ships.....	25; average passage, 112 days.
Barks.....	29; " " 118 "
Brigs.....	2; " " 127 "
Schooners.....	5; " " 124 "

Vessels, 173; aggregate tonnage, 77,639.

Four American brigs made the passage in 90 days, and one schooner in 91 days. These vessels were laden with flour, provisions, lumber, and general cargo. When the market is not overstocked, as was the case in 1853, American flour of the best quality (and none else need be exported) brings from \$15 60 to \$16 80 per barrel. Twelve dollars can be laid as the fixed market price for first quality flour, at least until the Australians pay more attention to agricultural pursuits, which will hardly be the case so long as they can find gold nuggets weighing 98½ lbs. each. American provisions, hams, bacon, butter, cheese, beef, pork, preserves, furniture, wooden houses, carriages, wagons, boots, etc., are much sought for in the markets of Victoria, and always command remunerative prices. The facilities for discharging and dispatching ships have greatly increased within the past year. Before that period, 90 days was considered good dispatch; now from 12 to 30 days is the time; and, indeed, 30 days is considered unwarrantably long.

It may be interesting, and not altogether inappropri-

ate, to notice in this place the astonishing production of gold in this colony, compared with the aggregate mining operations in other parts of the world, especially in California. The gold diggings in Victoria extend from long. 142° 35' to 147° 30', and from lat. 36° 20' to 37° 40', over districts embracing more than 300,000 square miles, or more than half the area of the colony.

VICTORIA GOLD.

	Ounces.	Amount.
From the end of September, 1851, to December 31, 1852.....	4,608,188	\$88,707,620
From December, 1852, to December, 1853.....	3,090,342	59,499,080
From December, 1853, to September, 1854 (by escort only).....	1,130,519	22,610,380
Total.....	8,829,049	\$170,807,080

COMPARISON OF THE AVERAGE YEARLY PRODUCE OF GOLD.

Victoria.....	\$60,000,000
California.....	55,000,000
Russia (Ural Mountains).....	20,000,000
Aggregate amount (annual) of Victoria, California, and Russian mines.....	\$135,000,000

—See articles AUSTRALIA and MELBOURNE.

Vikings, or Sea Kings, among the Danes or Normans leaders of piratical squadrons, who passed their lives in roving the seas in search of spoil and adventures. The younger sons of the Scandinavian kings or earls, having no inheritance but the ocean, naturally collected around their standards the youth of inferior order, who were equally destitute with themselves. These were the same who in England and Scotland, under the name of *Danes*, and on the continent under that of *Normans*, at first desolated the maritime coasts, and afterward penetrated into the interior of countries, and formed permanent settlements in their conquests.

Vine. The vine was known to Noah. A colony of vine-dressers from Phocæa, in Ionia, settled at Marseilles, and instructed the South Gauls in tillage, vine-dressing, and commerce, about 600 B.C. Some think the vines are aborigines of Languedoc, Provence, and Sicily, and that they grew spontaneously on the Mediterranean shores of Italy, France, and Spain. The vine was carried into Champagne, and part of Germany, A.D. 279. The vine and sugar-cane were planted in Madeira in 1420. It was planted in England in 1552; and in the gardens of Hampton-court palace is an old and celebrated vine said to surpass any known vine in Europe.—See GRAPES and WINE. The following is a tradition in relation to the vine: "When Adam planted the first vine and left it, Satan approached it, and said, 'Lovely plant! I will cherish thee'; and thereupon taking three animals, a lamb, a lion, and a hog, he slayed them at the root of the tree, and their blood has been imbibed by the fruit to this day. Thus, if you take one goblet of wine, you are cheered by its influence, yet are mild and docile as the lamb; if you take two goblets, you become furious, and rave and bellow like the lion; and if you drink of the third goblet, your reason sinks, and, like the hog, you wallow in the mire."—ASHIE. See WINE.

Vinegar (Ger. *Essig*; Du. *Azyn*; Fr. *Vinaigre*; It. *Aceto*; Sp. and Port. *Vinagre*; Russ. *Ukhus*; Lat. *Acetum*).—See ACID (ACETIC), for a description of vinegar. Vinegar was known nearly as soon as wine. The ancients had several kinds of vinegar which they used for drink. The Roman soldiers were accustomed to take it in their marches. The Bible represents Boaz, a rich citizen of Bethlehem, as providing vinegar for his reapers, into which they might dip their bread, and kindly inviting Ruth to share with them in their repast: hence we may infer that the harvesters at that period partook of this liquid for their refreshment—a custom still prevalent in Spain and Italy. It is conjectured that the vinegar which the Roman soldiers offered to our Saviour at his crucifixion was that which they used for their own drinking. There was, however, a kind of potent vinegar which was not proper for drinking till diluted.

EXPORTS OF VINEGAR FROM THE UNITED STATES FOR THE
YEAR ENDING JUNE 30, 1857.

There were no imports of vinegar into the United States for the year 1857.

Viol and Violin. As the lyre of the Greeks was the harp of the moderns, so the viol and vielle of the Middle Ages became the modern violin. The viol was of various sizes formerly, as it is at present, and was anciently very much in use for chamber airs and songs. That of three strings was introduced into Europe by the jugglers of the 13th century. The violin was invented toward the close of the same century.—**ABBÉ LENGLET.** The fiddle, however, is mentioned as early as A.D. 1200, in the legendary life of St. Christopher. It was introduced into England, some say, by Charles II. in 1684.

Virginia, one of the United States of America, lies between lat. 36° 33' and 110° 48' N., and between long. 75° 25' and 83° 40' W. It is 370 miles long, and 200 miles broad at its greatest breadth, containing 61,352 square miles. Population in 1790, 747,610; in 1800, 886,149; in 1810, 974,622; in 1820, 1,065,366; in 1830, 1,211,272; in 1840, 1,230,797; and in 1850, 1,421,661.

Early History.—The coast of the country which we now name Virginia is said to have been known to the old Northmen. One of them, Gudleif Gudlaugson, is said to have sailed in the year 1028 so far to the south. He is supposed to have called the country *Huitramannaland*, the Land of the Whitemen, which may be considered the oldest and first name under which these regions became ever known to the Europeans.

The Spaniards, since 1520, included the land under the names of *Terra de Ayllon* and *Florida*, and the French, since 1563, under the name of *Nouvelle France*. The English invented the name Virginia at first (1583) for the country lying round Pamlico and Albemarle Sound. They composed this name, it is said, for two reasons: first, because it was discovered in the reign of their Virgin Queen, Elizabeth; and, secondly, "because the country seemed still to retain the virgin purity and plenty of the first creation, and the people there the primitive innocence."

They extended this name at once over a great part of the east coast, and particularly over the vicinity of Chesapeake Bay, which was already discovered from the Roanoke settlements, and which we see included under the name of Virginia on the first map of Virginia, 1590.

When, since 1606, the Chesapeake Bay was better explored and settled, and when it became the principal centre of the English settlements on the east coast, this region was, par excellence, called Virginia, sometimes New Virginia, while the former settlements and country round Albemarle Sound, then forsaken, were sometimes (for instance, on a map of Captain J. Smith) called

Old Virginia. This was, however, more a popular manner of denomination. The official or legal name of the country was, in the year 1606, by King James I. thus confined: He called Virginia, or the Virginian territory or coast, the whole east coast of North America, from the thirty-fourth to the forty-fifth degree of north latitude. This whole territory was divided by the royal patent into two parts, a northern and a southern. The southern commenced in the south at 34° north latitude, and ended in the north at about 40° north latitude. It was called the First Colony, or the Southern Settlements in Virginia, or Virginia proper.

When Captain J. Smith and Prince Charles invented and introduced (1616) for Northern Virginia the new name of New England, the appellation Southern Virginia disappeared, and was changed to Virginia.

By the separation of the territories of Maryland (1632), of Carolina (1629), and of Carolina (1668), the name and province of Virginia lost a great deal of their former extension, and received at last their present limits, between 38° and 36½° north latitude, so far as our coast is concerned. The changes of the boundaries toward the interior regions have no interest here for us.—**KOHL.**

Physical Features, etc.—As regards surface and soil, this State may be divided into four sections. The eastern includes a tract of about 100 to 120 miles in width, and is generally low and level, and in some places marshy. It has a light sandy soil, mostly covered with pines. West of the line of the head of tide-water the country becomes undulating and hilly, until it attains one continuous mountain elevation known as the Blue Ridge, crossing the entire width of the State. The alluvial lands in this tract are for the most part very fertile, those of James River especially being unusually productive. The third section includes the valley between the Blue Ridge and the Alleghany Mountains. This tract, though in parts broken by mountains, is generally the most fertile and healthy part of the State. The fourth section includes the country between the Alleghany chain and the Ohio. This portion, though in many places wild and broken, has a great deal of fine fertile land, and vast deposits of coal, iron, salt, etc. Gold is found in Fluvanna and Buckingham counties and vicinity; and many valuable mineral springs exist.

There were in this State in 1850, 10,360,135 acres of land improved; and 15,792,176 unimproved land in farms; cash value of farms, \$216,401,543; and the value of implements and machinery, \$7,021,772. *Live Stock.*—Horses, 272,403; asses and mules, 21,483; milch cows, 317,619; working oxen, 89,513; other cattle, 669,137; sheep, 1,310,004; swine, 1,829,843. Value of live stock, \$33,656,659.

Agricultural Products, etc.—Wheat, 11,212,616 bushels; rye, 458,930; Indian corn, 35,224,319; oats, 10,179,143; barley, 25,437; buckwheat, 214,898; peas and beans, 521,579; potatoes, 1,816,933; sweet potatoes, 1,813,634; rice, 17,154 lbs.; value of products of the orchard, \$177,137; produce of market gardens, \$183,047; pounds of butter made, 11,089,359; of cheese, 436,292; maple-sugar, 1,227,665 lbs.; molasses, 40,322 gallons; beeswax and honey, 880,767; wool, 2,860,765 lbs. produced; cotton, 3947; flax, 1,000,450; silk cocoons, 517; hops, 11,506 lbs.; tobacco, 56,803,227; hay, 369,098 tons; hemp, 88 tons; clover seeds, 29,727 bushels; other grass seeds, 53,428; flax-seed, 52,318 bushels; and were made, 5408 gallons of wine; value of home-made manufactures, \$2,156,312; of slaughtered animals, \$7,502,986.

Rivers, etc.—The Potomac River separates Virginia from Maryland. James River is the largest which belongs to this State. It is 500 miles in length, and flows from the mountains in the interior behind the Blue Ridge, through which it passes. It is navigable for sloops 120 miles, and for boats much farther, and

flows into Chesapeake Bay. The Appomattox is 130 miles long, and enters James River 100 miles above Hampton Roads, and is navigable 12 miles to Petersburg. The Rappahannock, 180 miles long, and navigable 110 miles for sloops, rises in the Blue Ridge, and flows into the Chesapeake. York River enters the Chesapeake 30 miles below the Rappahannock, and is navigable 40 miles for ships. The Shenandoah enters the Potomac just before its passage through the Blue Ridge. Of the rivers west of the mountains, the Great Kanawha rises in North Carolina, passes through this State and enters the Ohio. The Little Kanawha also flows into the Ohio. The Monongahela rises in this State, though it runs chiefly in Pennsylvania. The lower part of Chesapeake Bay lies wholly in this State, is 15 miles wide at its mouth, and enters the Atlantic between Cape Charles and Cape Henry.

Manufactures, etc.—There were in the State in 1850, 24 cotton factories, with a capital invested of \$1,893,200, employing 1148 males and 1578 females, producing articles valued at \$1,438,109; 41 woolen factories, with a capital of \$324,700, manufacturing woolen goods val-

ued at \$690,802. Total capital invested in manufactures, \$18,108,793. Value of manufactured articles, \$20,000,000. There were in January, 1856, 21 railroads, with 1295 miles of railroad finished and in operation, and 1180 in course of construction.

Principal Ports.—Alexandria, 100 miles from the Chesapeake Bay, lat. 38° 48' N.; long. 0° 8' W. from Washington. It is finely situated on the right bank of the Potomac, which has a depth of water here sufficient for vessels of the largest class, being about 24 feet at the wharves, and 40 feet in the channel. The tonnage in 1856 was 7221 tons. Norfolk, situated on the Elizabeth River, eight miles from Hampton Roads, Chesapeake Bay, in lat. 37° 12' N., and long. 76° 40' W. Its harbor is capacious and deep, easy of access, and safe in all weathers. The Roads are formed by an enlargement of James River at its mouth, in Chesapeake Bay, and they offer an anchorage unsurpassed in the world. On the opposite side of the river is Portsmouth, in connection with which it is the chief naval station of the Union. The tonnage of Norfolk in 1856 was 27,757 tons.

FOREIGN COMMERCE OF THE STATE OF VIRGINIA, FROM OCTOBER 1, 1820, TO JULY 1, 1857, SHOWING ALSO THE DISTRICT TONNAGE IN 1821, 1831, 1841, AND 1851.

Voyages. The first great voyage, or voyage prop-

erly so called, was by order of Necho, pharaoh of Egypt, when some Phœnician pilots sailed from Egypt down the Arabic Gulf, round what is now called the Cape of Good Hope, entered the Mediterranean by the Straits of Gibraltar, coasted along the north of Africa, and at length arrived in Egypt, after a navigation of about three years, 604 B.C.—BLAIR, HERODOTUS. The first voyage round the world was made by a ship, part of a Spanish squadron which had been under the command of Magellan (who was killed at the Philippines Islands in a skirmish) in 1519-'20. The era of voyages of discovery was the end of the 18th century.—See COMMERCE, *History of*; PACIFIC OCEAN, etc.

W.

Wages. The wages of sundry workmen in England were first fixed by act of Parliament, 25 Edward III., 1350. Hay-makers had but one penny a day. Master carpenters, masons, tilers, and other coverers of houses, had not more than 8d. per day (about 9d. of the present currency, sterling), and their servants 1½d. —*VINER'S Statutes.* By the 23d Henry VI., 1444, the wages of a bailiff of husbandry was 28s. 4d. per annum, and clothing of the price of 6s., with meat and drink; chief hind, carter, or shepherd, 20s.; clothing, 4s.: common servant of husbandry, 15s.; clothing, 40d.: woman-servant, 10s.; clothing, 4s. By the 11th Henry VII., 1495, there was a like rate of wages, only with a little advance; as, for instance, a free mason, master carpenter, rough mason, bricklayer, master tiler, plumber, glazier, carver, or joiner, was allowed from Easter to Michaelmas to take 6d. a day, without meat and drink; or with meat and drink, 4d.; from Michaelmas to Easter, to abate 1d. A master having under him six men was allowed 1d. a day extra. The following were the wages of harvest-men in England at different periods:

Wake, the track of a ship which she leaves in the water. A vessel directly astern of another is said to be in her wake.

Wales, a peninsular portion of South Britain, on its west side, between lat. 51° 28' and 53° 26' N., and long. 2° 41' and 5° 17' W., having on the east the English counties of Chester, Salop, Hereford, and Monmouth, and on other sides the Bristol and St. George's channels and the Irish Sea.

Agriculture is extremely backward. Barley and oats are the chief grains raised; the culture of potatoes and turnips is extending. Farms mostly small, averaging in South Wales only from 50 to 60 acres, where, however, the tenantry are far better lodged than in the north. Large numbers of cattle are reared for the English markets. The number of sheep is estimated at 1,250,000, and the annual produce of wool at 10,000 packs. A hardy small breed of ponies is reared, especially in the counties of Montgomery and Merioneth. The mining interest is highly important. Iron, copper, lead, silver, slate, limestone, and in the south large quantities of coal are raised, which last product is extensively exported, and used in large quantities on the spot for smelting both British and foreign ores. In 1840 South Wales had 132 furnaces in operation, consuming annually about 1,436,000 tons of coal, and producing 505,000 tons of iron; and North Wales 12 furnaces, consuming 110,000 tons of coal, and producing 26,500 tons of iron. The principal iron-works are at and around Merthyr-Tydvil, Tredegar, Aberdare, and Rhubabon; at Swansea large quantities of American and other copper ores are reduced. Manufactures of woolen fabrics, especially of flannel and hosiery, are very generally pursued in the cottages of the peasantry, particularly in North Wales, where Welshpool is the chief mart for these products. The cotton manufacture has extended into some of the northern counties; and in 1847, 1860 hands were employed in woolen, cotton, and silk factories. A manufactory of slate articles exists at Bangor. Trade principally in the export of mineral produce, cattle, and woolen goods. Principal ports, Swansea, Newport, Cardiff, Caernarvon, and Beaumaris; besides which Holyhead is a chief packet station for communication with Ireland, and Milford is a naval port, and the seat of a government dock-yard. —See articles ENGLAND and GREAT BRITAIN.

Walnuts, the fruit of the *Juglans*, or walnut-tree, of which there are several varieties. The walnut is a large, handsome tree, with strong spreading branches. The fruit is a pretty, large, smooth, ovate nut, containing an oily kernel divided into four lobes. The nut has been always held in high estimation; it was called by the Romans *Jovis glans*, the acorn or mast of Jove, and hence the name of the tree.

The walnut-tree is indigenous to Persia and the countries bordering on the Caspian Sea. Previously to the very general introduction of mahogany, the wood of the walnut-tree was generally, and is yet extensively used in making of furniture. It is much used by turners, and is superior to every other sort of wood for the mounting of guns. Great numbers of walnut-trees are annually consumed in the Haute Vienne and other departments of France, in the manufacture of the wooden shoes or clogs used by the peasantry. The nuts are either gathered when ripe, being served up at desserts without any preparation, or they are plucked green and pickled.—*POIRET, Histoire Philosophique des Plantes*, tome vii.; *REES'S Cyclopædia*, etc.

Wampum (from *Wampi* or *Wompi*, signifying, in the Massachusetts Indian language, *white*, the color of the shells most frequent in wampum belts), shells, or strings of shells, used by the American Indians as money. These, when united, form a broad belt, which is worn as an ornament or girdle. It is sometimes called *wampumpague*, or *wampeague*, or *wampampeague*, of which *wampum* seems to be a contraction.

Wanghees, sometimes called Japan canes, a species of cane imported from China. They should be chosen pliable, tough, round, and taper; the knots at regular distances from each other, and the heavier the better. Such as are dark-colored, badly glazed, and light, should be rejected.—*MILBURN'S Orient. Com.* See article CANE.

Warehousing System. By this system is meant the provisions made for lodging imported articles in public warehouses at a reasonable rent, without payment of the duties on importation till they be withdrawn for home consumption. If re-exported, no duty is claimed.

Expediency and Origin of the Warehousing System.—

It is laid down by Dr. Smith, in one of his justly celebrated maxims on the subject of taxation, that "every tax ought to be levied at the time and in the manner that is most likely to be convenient for the contributor to pay it."—*Wealth of Nations*. No one can doubt the soundness of this maxim; and yet it was very strangely neglected, down to 1803, in the management of the customs. Previously to this period, the duties on most goods imported had either to be paid at the moment of their importation, or a *bond*, with sufficient security for their future payment, had to be given to the revenue officers. The hardship and inconvenience of such a system is obvious. It was often very difficult to find sureties; and the merchant, in order to raise funds to pay the duties, was frequently reduced to the ruinous necessity of selling his goods immediately on their arrival, when, perhaps, the market was already glutted. Neither was this the only inconvenience that grew out of this system; for the duties having to be paid all at once, and not by degrees as the goods were sold for consumption, their price was raised by the amount of the profit on the capital advanced in payment of the duties; competition, too, was diminished in consequence of the greater command of funds required to carry on trade under such disadvantages; and a few rich individuals were enabled to monopolize the importation of those commodities on which heavy duties were payable. The system had, besides, an obvious tendency to discourage the carrying trade. It prevented this country from becoming the entrepôt for

foreign products, by hindering the importation of such as were not immediately wanted for home consumption; and thus tended to lessen the resort of foreigners to our markets, inasmuch as it rendered it difficult, or rather impossible, for them to complete an assorted cargo. And in addition to all these circumstances, the difficulty of granting a really equivalent drawback to the exporters of such commodities as had paid duty, opened a door for the commission of every species of fraud.

Warehouses, in which unclaimed and bonded merchandise shall be stored, will hereafter be known and designated as follows:

1st. Stores owned by the United States, or hired by them, prior to the date of these instructions, the leases of which have not yet expired or been canceled. All unclaimed goods must be stored in these stores when there are such at the port available for the purpose; and they are also to be used for the storage of other foreign merchandise, as hereinafter provided. All the labor in these stores shall be performed under the superintendence of the officer in charge, at the expense of the owner or importer of the merchandise; and all charges for storage, labor, and other expenses accruing on the goods, shall not exceed the regular rates for such objects at the port.

Stores of this description will be known and designated as Class 1.

2d. Stores in the possession of an importer and in his sole occupancy, which he may desire to place under the customs lock, in addition to his own lock (said locks to be of a different character), for the purpose of storing dutiable merchandise imported by himself only.

The entire store shall be appropriated to this sole purpose, under the regulations hereinafter provided; and for the time of the customs officer necessarily required in attendance at such store, the proprietor shall pay monthly to the collector of the port a sum equivalent to the pay of such officer. All the labor on goods so stored must be performed by the importer at his own expense, under the supervision of the officer in charge. Before any importer shall be permitted to use his own store for such purpose, he shall enter into a bond in such sum and with such securities as may be approved by the collector and this Department.

Stores of this description will be known and designated as Class 2.

3d. Stores in the occupancy of persons desiring to engage in the business of storing dutiable merchandise under the warehouse acts, and of performing the labor on such goods, in what is usually termed the storage business. The labor performed on the goods in stores of this class shall be under the control and expense of the owner or occupant; and the store shall be subject to such further rules as this Department may deem necessary, from time to time, for the safe-keeping of the goods and protection of the revenue, and to be discontinued as a bonded warehouse when the public interest may require. All arrangements as regards the rates of storage and the price of labor in these stores must be made between the importer and the owner or occupant of the store, and all amounts due for storage and labor must be collected by the latter, the collector looking only to the safe custody of the merchandise for the security of the revenue.

Before any person shall be permitted to open a store of this description, he shall enter into bond in such sum and with such securities as may be approved by the collector and this Department.

Unclaimed and seized goods may be stored in this class of stores on the order of the collector; and the proprietor or occupant shall look to the goods for the storage and charges, at the usual and customary rates, and shall be liable for the safe-keeping of the merchandise as for other storage. The collector shall give no permit to withdraw such goods without payment of the legal duties and charges; and, if sold, shall cause the

storage and charges to be paid out of the proceeds of the sale.

Stores of this description will be known and designated as Class 3.

These stores shall be placed in charge of an officer of the customs, under the separate and different locks of the custom-house, and the owner or occupant acting as agent for the importers warehousing their merchandise in such stores. Should the amount of business at any one store require, in the judgment of the collector, the services of more than one officer, the owner or occupant shall be required to pay monthly such additional sum as will be equivalent to the salary of such officer or officers.

4th. For the storage of wood, coal, mahogany, dyewoods, lumber, molasses, sugar in hogsheads and tierces, railroad, pig, and bar iron, anchors, chain cables, and other articles specially authorized, yards or sheds of suitable construction may be used, to be bonded in the manner herein before prescribed. These yards must be inclosed by substantial fences not less than twelve feet in height, with gates provided with suitable bars and other fastenings, so as to admit of being secured by customs locks, and must be used exclusively for the storage of the above-named merchandise, duly entered for warehousing by the owner or occupant, or for the purpose of general storage of warehoused goods; the purpose to be set forth in the application, and the bond to be taken accordingly, as in case of warehouses of the second and third classes. The sheds must be substantially constructed, with or without flooring or roofing, as this Department and the collector may require; and, when required, the roof or exterior shall be covered with slate or metal. The doors and other openings must be provided with suitable fastenings, and be secured by the different and separate locks of the occupant and the customs; and the occupant shall provide a proper room for the use of the officer in charge. Collectors of the customs may order unclaimed and seized merchandise of the description authorized (when duly entered), to be deposited in sheds or yards, to be placed in such sheds or yards under the same regulations and conditions as are provided for the deposit of unclaimed or seized goods in warehouses of Class No. 3.

Sheds and yards of the foregoing description will be designated and known as Class 4.

The owner or lessee of a store occupied for general business purposes may use the cellar or vault of such store, under the conditions hereinafter prescribed, as a bonded warehouse of Class 2, for the storage of wines and distilled spirits only, and exclusively of his own importation.

The entire cellar or vault shall be appropriated to this purpose, and shall have no opening or entrance except the one from the street, on which the separate and different locks of the customs and the owner or proprietor of the cellar shall be placed; and a bond shall be entered into by the owner according to the foregoing form of stores of Class 2.—For articles on Warehousing and Dock System, see HUNT's *Merchants' Magazine*, vii., xiv., xv.; DE BOW's *Rev.*, i.; NILES's *Register*, xxxv., xxxvi.

Warp, in weaving, the *longitudinal* threads of a woven fabric; they are crossed by the *transverse* threads, or *woof*. **Warp**, a rope or hawser employed occasionally to remove a ship from one place to another in a port, road, or river. Hence to *warp* is to change the position of a ship by pulling her from one part of a harbor, etc., to some other, by means of warps, which are attached to buoys, to other ships, to anchors sunk in the bottom, or to certain stations upon the shore, as posts, rings, trees, etc.

Washington, the capital of the United States of America, is situated on the left bank of the Potomac, at its confluence with the Anacostia, and at the termination of the Washington branch of the Baltimore and

Ohio Railroad. Lat. (of the National Observatory) $38^{\circ} 53' 39''$ N., long. $77^{\circ} 2' 48''$ W. from Greenwich, England. It is 295 miles from the ocean by the course of the river, 38 from Baltimore, and 225 from New York. The population in 1800 was 3210; in 1810, 8208; in 1820, 13,247; in 1830, 18,827; in 1840, 23,864; in 1850, 45,000; and in 1854, 46,000.

The *Navy Yard* is situated on the "Anacostia," a branch of the Potomac River, at the southern termination of Eighth Street, east. It covers an area of about twenty acres, and is inclosed by a substantial brick wall, having a principal entrance at the foot of Eighth Street, through a handsome arched gateway. The mechanical operations of this establishment are various and extensive, and the skill of the workmen and the excellence of the materials employed have been satisfactorily tested in every sea. Anchors of various sizes, for the naval service, are manufactured by the use of two heavy steam-hammers (termed the "Nasmyth Hammer"), one of which weighs 3600 lbs., the other 2240 lbs. The forges for this work are kept in blast by a fan-blower attached to the steam-engine in the machinist's department. There is also in operation, in the anchor department, a direct action steam-hammer (called the "Kirk Hammer"), in connection with a blast furnace for working up into looms and bars all the scrap iron of the navy. The massive chain cables are made in another shop, which is provided with a powerful hydrostatic press for testing their strength. —See article DISTRICT OF COLUMBIA for commerce of Washington.

Washington, a territory of the United States of America, lies between lat. $45^{\circ} 25'$ N., long. $108^{\circ} 30'$ and $124^{\circ} 30'$ W. Area, 113,821 square miles. It is between the Rocky Mountains on the east and the Pacific Ocean on the west, has Oregon on its south border, and the British possessions on the north. The entire population in 1850 was 1201; in 1854, estimated at 5000. It is divided into six counties, viz.: Clark, Lewis, Pacific, Pierce, Stevens, and Thurston. The country west of the Cascade Range is the only portion yet settled by a white population; it has a diversified surface, and the valleys bordering the streams have a luxuriant soil. The streams are small, the Cowlitz and other small streams entering the Columbia River on the south, the Chickeelas entering Gray's harbor on the west, and a number of other streams entering Puget Sound on the northwest. Puget Sound, Hood's Canal, and Admiralty Inlet abound with fine harbors. The Cascade Range crosses the territory from the south (at the Cascades, on the Columbia River) entirely across it to the north, rising in several peaks above the snow line, as Mount St. Helens (an active volcano), Mount Rainier, Mount Baker, etc. East of this range little is known of the capabilities of the country as an agricultural region, although there is no doubt of its being well adapted for stock raising. It is drained by the constituents of the Columbia, consisting of Kooskoosky and Peloose rivers of the Lewis Fork, and Spokane, Okonagan, Barrier, and Yakima rivers of Clark's Fork, and Cathalacades entering the Columbia River.

The Strait of *Juan de Fuca*, including the waters of Admiralty Inlet, Hood Canal, and Puget Sound, with the Archipelago of Arro up to the 49th parallel, were all surveyed by the United States Exploring Expedition. The whole is unsurpassed by any estuary in the world. They comprise many very fine harbors and safe anchorages, are entirely free from dangers, and cover an area of about 2000 square miles. The country by which these waters are surrounded is remarkably salubrious, and offers every advantage for the accommodations of a vast commercial and military marine, with conveniences for docks, and many sites for towns and cities, at all times well supplied with water, and capable of being provided with all needful supplies from the surrounding country, which is well adapted for agriculture. This strait is ninety-five miles in

length; average width eleven miles (entrance eight miles in width); no dangers exist, and it may be safely navigated throughout. This territory was separated from Oregon in the year 1853, and constituted a separate territory. —HARPER'S Gazetteer.

Watches (Ger. *Uhren*, *Taschenuhren*; Fr. *Montres*; It. *Oriuoli da tasca*, o *da succoccia*; Sp. *Relojos de faltriguera*; Russ. *Karmannie tschasui*), portable machines, generally of a small size, and round, flat shape, that measure and indicate the successive portions of time, having for the most part their motions regulated by a spiral spring. When constructed on the most approved principles, and executed in the best manner, a watch is not only an exceedingly useful, but a most admirable piece of mechanism. It has exercised the genius and invention of the most skillful mechanics, as well as of some of the ablest mathematicians, for nearly three centuries. And, considering the smallness of its size, its capacity of being carried about uninjured in every variety of position, the number and complexity of its movements, and the extraordinary accuracy with which it represents the successive portions of time as determined by the rotation of the earth on its axis, we need not wonder at Dr. Paley having referred to it as a striking specimen of human ingenuity. Spring watches are constructed nearly on the same principle as pendulum clocks. Instead of the pendulum in the latter, a spring is used in the former, the isochronism of the vibrations of which corrects the unequal motions of the balance.

Historical Notice.—The invention of spring watches dates from about the middle of the 16th century, and has been warmly contested for Huygens and Hooke. The English writers generally incline in favor of the latter. Dr. Hutton says (*Mathematical Dictionary*, art. WATCH) that the words "Rob. Hooke invenit, 1658," were inscribed on the dial plate of a watch presented to Charles II. in 1675. But Montucla affirms (*Histoire des Mathématiques*, tome ii. p. 413, ed. 1800) that Huygens made this "*belle découverte*" in 1656, and presented a spring watch to the states of Holland in 1657. Comparing these statements, it certainly appears that the claim of Huygens to the priority of the discovery is the better established of the two. We do not, however, believe that either of those distinguished persons owed, in this respect, anything to the other. The probability seems to be, that the happy idea of employing a spring to regulate the motion of watches occurred to them both nearly at the same time.

Improvement of Watches.—Owing to the facility with which the longitude may be determined by the aid of accurately going watches, it is of great importance to have them made as perfect as possible. In this view, liberal premiums have been given to the makers of the best marine watches, or chronometers. In the reign of Queen Anne, Parliament offered a reward of £20,000 to any one who should make a watch, or other instrument capable of determining the longitude at sea, within certain limits. This magnificent premium was awarded, in 1764, to the celebrated John Harrison, for a marine watch, which, being tried in a voyage to Barbadoes, determined its longitude with even more than the required accuracy. Other premiums, though of inferior amount, were subsequently given to Messrs. Mudge, Arnold, Earnshaw, etc. Since 1822, two prizes, one of £300 and one of £200, have been annually given to the makers of the two chronometers adjudged to be the best, after having been submitted to a twelve-month's trial at the Royal Observatory at Greenwich. And to such perfection has the manufacture attained, that some of the chronometers employed by navigators, though carried into the most opposite climates, have not varied to the extent of two seconds in their mean rate of going throughout the year.

Watch Manufacture.—The watch-making business is largely carried on in London; the artists of which have attained to a high degree of excellence in this de-

partment. There may be about 14,000 gold and 85,000 silver watches annually assayed at Goldsmiths' Hall, London (*Jacob on the Precious Metals*, vol. ii. p. 413), the aggregate value of which is, probably, not much under £600,000. The manufacture is also carried on to a considerable extent at Liverpool, Coventry, Edinburgh, etc. Watch movements used to be extensively manufactured at Prescot, in Lancashire; but latterly, we believe, the manufacturers have been withdrawing to Liverpool. On the Continent watches are principally manufactured in Paris, Geneva, and in Neuchâtel. Some of the French and Swiss watches, particularly the latter, are excellent; but, generally speaking, they are slight, and inferior to those made in London. Paris and Geneva watches are largely exported to foreign countries, and are every where in high estimation, particularly among the ladies. Watches impressed with any mark or stamp, appearing to be or to represent any legal British assay mark or stamp, or purporting by any mark or appearance to be of the manufacture of the United Kingdom, or not having the name and place of abode of some foreign maker abroad visible on the frame and also on the face, or not being in a complete state, with all the parts properly fixed in the case, may not be imported into the United Kingdom, even for the purpose of being warehoused. —3 and 4 Will. IV., c. 52, § 58.

Watches in China.—Large numbers of European watches are imported into China; and it may be worth mentioning, as a curious instance of the diversity of tastes, that the Chinese, as well as most other Eastern nations, who can afford it, uniformly wear watches in pairs! This sort of extravagance is not, however, confined to watches, but extends to a variety of other articles. Shawls, for example, are invariably worn in India in pairs of exactly the same pattern; and it is hardly possible, indeed, to find a native dealer who will sell a single shawl.

Watches and Clocks.—Out of thirty-one clock manufactories in New England in 1852, four have been destroyed by fire, nine have stopped by failure, and five have stopped manufacturing on account of small profits. There are still thirteen factories making clocks, but only six of them are running full time, and with a full complement of hands. These six will produce about 95,000 clocks this year. The remaining seven factories will make about 48,000 clocks, so that the total production of clocks this year will not exceed 143,000.

The Jerome Manufacturing Company, in 1853 and 1854, produced each year 444,000 clocks. Thus they must have produced more than an average of one clock per minute. The factory of J. C. Brown, during 1851 and 1852, issued from 80,000 to 100,000 clocks annually, making a total from the two establishments of over 500,000 clocks each year. The Ansonia Company manufactured about 150,000 last year. Thus it will be seen that all the thirteen factories now running will make hardly one-fourth of what was produced by three of the large factories now standing still. The question naturally arises, What shall we do for low-priced clocks in the future? There is still a large amount of fancy clocks on hand, but the wooden-frame "ogee" and "sharp-top Gothic" clocks are not being made, and there is comparatively none in the market. The wooden-frame clocks can not be made for the prices that they have been sold at. It is estimated that nearly half a million of dollars have been lost in selling clocks under the cost within the last three years. The clocks for exportation have amounted to about one million of dollars annually, which aided us in the exchanges with the old country. As an instance, we know one house that imports shawls, linen, collars, and lace goods from Scotland, and makes its exchange in clocks. But if they were to send a bill of exchange it would cost them from 7 to 8 per cent.; but sending out clocks at 5 per cent. profit or more, it makes them

at least 13 per cent. on the clocks, which is a paying business. There are doubtless many similar agents in the exportation of the article, which is an advantage to ourselves; and for this reason we desire to see it fostered, and again take its place among the industrial products of our country.—See HUNT's *Merchants' Magazine*, January, 1857.

The following table shows the value of clocks imported into and exported from the United States during the year ending June 30, 1855, derived from the annual report of the Secretary of the Treasury:

Countries.	Imported.	Exported.
Hamburg	\$684
Bremen	1,481
Belgium	163
England	15,902	\$4200
Ireland	50
Canada	5	1598
France	50,577	483
Papal States	17
Mexico	141
New Granada	4
Venezuela	175
China	59
Total	\$63,258	\$6251

IMPORTS OF WATCHES AND PARTS OF WATCHES INTO THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1857.

Whence imported.	Watches and parts of.	Watch Crystals.	
		Gross.	Value.
Russian Poss. in N. Amer..	\$1,620
Hamburg	1,272

Venezuela	140
Brazil	1,455
Total, 1856-57	\$3,823,039	17,820	\$32,170

Water. It may be thought unnecessary, perhaps, to say any thing in a work of this sort with respect to a fluid so well known and so abundant. But, besides being an indispensable necessary of life, water is, in most large cities, an *important commercial article*. It is in the latter point of view principally that we mean to consider it. Inasmuch, however, as the mode of supplying different places with water, and its price, necessarily vary in every possible way, we shall limit our remarks on these subjects to the metropolis only. The few remarks we intend to offer of a general nature will apply indifferently to any populous place, the supply of which with water occasions a considerable expense.

Quality of Water.—Dr. Ure has made the following statements with respect to the quality of water: "Water," says he, "is a very transparent fluid, possessing a moderate degree of activity with regard to organized substances, which renders it friendly to animal and vegetable life, for both which it is, indeed, indispensably necessary. Hence it acts but slightly on the organs of sense, and is therefore said to have neither taste nor smell. It appears to possess considerable elasticity, and yields in a perceptible degree to the pressure of air in the condensing machine. Native water is seldom, if ever, found perfectly pure. The waters that flow within or upon the surface of the earth contain various earthy, saline, metallic, vegetable, or animal particles, according to the substances over or through which they pass. Rain and snow water are much purer than these, although they also contain whatever floats in the air, or has been exhaled along with the watery vapors.

"The purity of water may be known by the following marks or properties of pure water: 1. Pure water is lighter than water that is not pure. 2. Pure water is more fluid than water that is not pure. 3. It has no color, smell, or taste. 4. It wets more easily than the

waters containing metallic and earthy salts, called hard waters, and feels softer when touched. 5. Soap, or a solution of soap in alcohol, mixes easily and perfectly with it. 6. It is not rendered turbid by adding to it a solution of gold in *aqua regia*; or a solution of silver, or of lead, or of mercury, in nitric acid; or a solution of acetate of lead in water.

"Water was, till modern times, considered as an elementary or simple substance; but it is now ascertained to be a compound of oxygen and hydrogen."

To evaporate water enough annually from the ocean to cover the earth, on the average, five feet deep with rain; to transport it from one zone to another; and to precipitate it in the right places, at suitable times and in the proportions due, is one of the offices of the grand atmospherical machine. This water is evaporated principally from the torrid zone. Supposing it all to come thence, we shall have encircling the earth a belt of ocean three thousand miles in breadth, from which this atmosphere evaporates a layer of water annually sixteen feet in depth. And to hoist up as high as the clouds, and lower down again all the water in a lake sixteen feet deep, and three thousand miles broad, and twenty-four thousand long, is the yearly business of this invisible machinery. What a powerful engine is the atmosphere! and how nicely adjusted must be all the cogs, and wheels, and springs, and compensations of this exquisite piece of machinery, that it never wears out nor breaks down, nor fails to do its work at the right time and in the right way!

In his annual report to the society (*Transactions of the Bombay Geographical Society* from May, 1849, to August, 1850, vol. ix.), Dr. Buist, the secretary, states, on the authority of Mr. Laidly, the evaporation at Calcutta to be "about fifteen feet annually; that between the Cape and Calcutta it averages, in October and November, nearly three-fourths of an inch daily; between 10° and 20°, in the Bay of Bengal, it was found to exceed an inch daily. Supposing this to be double the average throughout the year, we should," continues the doctor, "have eighteen feet of evaporation annually."—MAURY, *Phys. Geog.*

Water for Ships.—Various improvements have been made in the art of preserving water on board ships. Of these the principal are the charring the inside of the casks in which the water is kept, and the substitution of iron tanks for casks. The latter, being made of the required shape, may be conveniently stowed into any part of the ship. In men-of-war the iron tanks serve as ballast, the water being brought up by a forcing-pump. Water is found to preserve better in them than in any other sort of vessel. Drip-stones may be employed with much advantage in the purification of water. When water is taken on board from a river into which the tide flows, it should, of course, be raised at low ebb.—See article **AQUEDUCT** for an account of the supply of water in New York given by the Croton Aqueduct. See articles **GULF STREAM**, **HARBORS**, **OCEAN**, **TIDES**, etc.

Water-clocks. The first instruments used to measure the lapse of time, independently of the sunshine, were *clepsydra*, or water-clocks. These were most probably vessels of water, with a small hole through the bottom; through this hole the water ran out in a certain time, possibly an hour; after which the vessel was again filled, to be emptied as before. This invention was a manifest improvement on the old sun-dials, whose perpendicular gnomon gave hours of different length at the various seasons of the year. Something similar to the hour-glass was occasionally used; and Alfred the Great, probably ignorant of these methods, adopted the burning of a taper as a measure of time.—HAYDN.

Water-line, the boundary of any horizontal section of the bottom of a ship. The uppermost one is called the load water-line; the lowest the light water-line.

Water-logged, a nautical term, denoting the state of a ship when a quantity of water having been received into the hold by leaking, etc., she has in a great measure lost her buoyancy, and yields to the effect of every wave passing over the deck.

Water-mills, used for grinding corn, invented by Belisarius, the general of Justinian, while besieged in Rome by the Goths, A.D. 555. The ancients parched their corn, and pounded it in mortars. Afterward mills were invented, which were turned by men and beasts with great labor; and yet Pliny mentions wheels turned by water.—HAYDN.

Water-ways, strong pieces of wood extending round the ship, at the junction of the decks with the sides, to carry off the water.

Wave. The common cause of waves is the friction of the wind upon the surface of the water. Little ridges or elevations first appear, which, by continuance of the force, gradually increase until they become rolling mountains, where the winds sweep over a great extent of water. In rounding the Cape of Good Hope, waves, or rather a swell, are met with so vast, that a few ridges and a few depressions occupy the extent of a mile. But these are not so troublesome to ships as a short swell with more perpendicular waves. The slope in the former is so gentle that the rising and falling are scarcely felt, while the latter, by the sudden plunging of the vessel, is often destructive. The velocity of waves has relation to their magnitude. The large waves just mentioned proceed at the rate of from thirty to forty miles an hour. It is a common error to suppose that the water itself advances with the speed of the wave; but, in fact, the form only advances: the substance, with the exception of a little spray, remains rising and falling in the same place with the regularity of a pendulum. When a wave, however, reaches a shallow bank or beach, the water becomes really progressive; because then, as it can not sink directly down, it falls over forward. No wave rises more than ten feet above the level of the water, which, with the ten feet of descent, gives twenty feet for the whole height of the wave above the next depression. A wave coming against any obstacle may be dashed up to a much greater elevation.—E. A. See *American Journal of Science*, ix. (W. SCORESBY). See also articles **OCEAN**, **TIDES**, **WATER**, etc.

Wax (Ger. *Wachs*; Fr. *Cire*; It. and Sp. *Cera*; Russ. *Wosk*), a vegetable product. Several plants contain wax in such abundance as to make it worth while to extract it from them. But all that is known in commerce consists of beeswax. The honey is first pressed from the comb, and the wax is then melted into cakes. It has a slight odor of honey, is insipid, and of a bright yellow hue. It is brittle, yet soft, and somewhat unctuous to the touch. It is often adulterated with earth, pea meal, resin, etc. The presence of the former may be suspected when the cake is very brittle, or when its color inclines more to gray than to yellow; and the presence of resin may be suspected when the fracture appears smooth and shining, instead of being granulated. Wax, when bleached or purified, is white, perfectly insipid, inodorous, and somewhat translucent; it is harder, less unctuous to the touch, heavier, and less fusible than yellow wax. It is sometimes adulterated with the white oxyd of lead to increase its weight, with white tallow, and with potato starch. The first is detected by melting the wax in water, when the oxyd falls to the bottom; the presence of tallow is indicated by the wax being of a dull opaque white, and wanting the transparency which distinguishes pure wax; and starch may be detected by applying sulphuric acid to the suspected wax, as the acid carbonizes the starch, without acting on the wax.—THOMSON'S *Chemistry*, and Dr. A. T. THOMSON'S *Dispensatory*.

Beeswax is prepared by draining and washing the honey-comb, which is then melted in boiling water,

strained, and cast into cakes. English and foreign wax are found in the market; the latter being chiefly imported from the Baltic, the Levant, and the coast of Barbary. Fresh wax has a peculiar honey-like odor: its specific gravity is .96. At about 150° it fuses, and at a high temperature volatilizes, and burns with a bright white flame. It is bleached by being exposed in thin slices or ribbons to light, air, and moisture, or more rapidly by the action of chlorine; but in the latter case it does not answer for the manufacture of candles, which is one of its principal applications. Wax candles are made by suspending the wicks upon a hoop over the cauldron of melted wax, which is successively poured over them from a ladle till they have acquired the proper size, so that the candle consists of a series of layers of wax; the upper end is then shaped, and the lower cut off. Attempts have been made to cast wax candles in moulds, but when thus made they burn irregularly. Bleached or white wax is generally adulterated with more or less spermaceti, and sold at different prices accordingly; in this case it has not the peculiar lustre of pure wax, and is softer and more fusible. It is also largely adulterated with stearin or stearic acid, which is detected by the odor of fat or tallow which it evolves when highly heated, and by its crumbly texture; it may also be separated to a certain extent by ether or alcohol. Wax is insoluble in water, and scarcely acted upon by the acids, so that it forms a good lute or cement: boiling alcohol and ether act partially upon it, and deposit the portion which they had dissolved, on cooling. Some varieties of vegetable wax appear to contain two distinct principles, which Dr. John has termed *cerin* and *myrcin*; the former soluble, and the latter insoluble, in alcohol. Heated with the fixed alkalies, wax forms a difficultly soluble soap.

EXPORTS OF WAX FROM THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1857.

Way, the sea term for progress. A ship in progress is said to have *way* upon her; when stationary, to have no *way*.

Wealth. This is a relative term; for as there is only a certain amount of property in a country, so the possession of a large share by one man is the poverty of others. The instances of wealth in the early ages are many and most extraordinary. The mightiest conflagration of wealth on record is that of Sardapanulus, where riches amounting to one thousand four hundred millions sterling were destroyed.—*ATHENÆUS*. Cæcilius Isidorus died at Rome possessed of 4116 slaves, 3600 oxen, 200,000 head of other cattle, and money equal to three millions sterling, 8 B.C.—*Univ. Hist.* See articles BANKS, COINS, GOLD MONEY, etc.

Wear, to put the ship on the other tack by turning her round with her stern to the wind.

Wearing Apparel, generally considered to include only the clothes and personal property actually worn upon the person, and as such it is admitted free of duty into the United States.

Weaving, the art of forming cloth in a loom by the union or intertexture of threads. The art of weaving appears to have been practiced in China from the earliest antiquity—more than a thousand years before it was known in Europe or Asia. Poets assign the art to the spider. Women originally spun, wove, and dyed; and the origin of these arts is ascribed, by ancient nations, to different women as women's arts. The Egyptians ascribed it to Isis; the Greeks to Minerva; and the Peruvians to the wife of Manco Capac. In most Eastern countries, the employment of weaving is still performed by the women. Our Saviour's vest, or coat, had not any seam, being woven from the top throughout, in one whole piece. Perhaps, says Dr. Doddridge, this curious garment might be the work and present of some pious women who attended him, and ministered unto him of their substance, *Luke*, viii. 3. The print of a frame for weaving such a vest may be seen in *CALMET's Dictionary*, under the word *Vestments*. Two weavers from Brabant settled at York, where they manufactured woolens, which, says King Edward, "may prove of great benefit to us and our subjects," 1331. Flemish dyers, cloth-drapers, linen-makers, silk-throwsters, etc., settled at Canterbury, Norwich, Colchester, Southampton, and other places, on account of the Duke of Alva's persecution, 1567.—See articles COTTON MANUFACTURES, WOOLEN MANUFACTURES, and MANUFACTURES.

Weights and Measures. Weights are used to ascertain the gravity of bodies—a quality depending partly on their magnitude, and partly on their density. Measures are used to determine the magnitude of bodies, or the space which they occupy.—For an account of the weights and measures used in foreign countries, see articles under these heads.

Weights and measures, and the stamping of gold and silver money, were invented by Phylon, tyrant of Argos, 895 B.C. *et seq.*—*Arundelian Marbles*. Weights were originally taken from grains of wheat, the lowest being still called a grain.—*CHALMERS*. The standard measure was originally kept at Winchester by the law of King Edgar, A.D. 972. Standards of weights and

measures were provided for the whole kingdom of England by the sheriffs of London, 8 Richard I., 1197. A public weighing-machine was set up in London, and all commodities ordered to be weighed by the city officer, called the weigh-master, who was to do justice between buyer and seller, statute 3d Edward II., 1309.—**Stowe.** The first statute, directing the use of avoirdupois weight, is that of 24 Henry VIII., 1532.—*Philosophical Transactions*, vol. 65, art. 3. The French adopt the metre of 3·28084, or the 10-millionth part of the distance from the pole to the equator, as the standard of measure; and the kilogram, equal to 2255 lbs. avoirdupois, as the standard of weight.—**HAYDN.**

Neither the magnitude nor the weight of any body can be determined, unless by comparing it with some other body selected as a standard. It is impossible, indeed, to form any idea in respect of magnitude or weight, except in relation to some definite space or weight with which we are acquainted. We say that one article weighs 1 lb., another 2 lbs., a third 3, and so on; meaning not only that these weights are to each other as 1, 2, 3, etc., but also that the weight or specific gravity of the first is equal to the known and determinate weight denominated a lb., that the second is equal to 2 lbs., and so on.

Standards of Weight and Measure.—Standards of lineal measure must have been fixed upon at the earliest period, and appear to have consisted principally of parts of the human body—as the cubit, or length of the arm from the elbow to the tip of the middle finger; the foot; the *ulna*, arm, or yard; the span; the digit, or finger; the fathom, or space from the extremity of one hand to that of the other, when they are both extended in opposite directions; the pace, etc. Large spaces were estimated by measures formed out of multiples of the smaller ones; and sometimes in day's journeys, or by the space which it was supposed an ordinary man might travel in a day, using a reasonable degree of diligence. But lineal measures can only be used to determine the magnitude of solid bodies; the magnitude of bodies in a liquid or fluid state has to be determined by what are called measures of capacity. It is probable that, in the infancy of society, shells, or other hollow instruments afforded by nature, were used as standards. But the inaccuracy of the conclusions drawn from referring to them must soon have become obvious; and it early occurred that to obtain an accurate measure of liquids nothing more was necessary than to constitute an artificial one, the dimensions, and consequently the capacity, of which should be determined by the lineal measures previously adopted. The determination of the gravity or weight of different bodies supposes the invention of the balance. Nothing is known of the steps which led to its introduction; but it was used in the remotest antiquity. It seems probable that, at first, cubes of some common lineal measure, as a foot, or the fraction of a foot, formed of copper, iron, or some other metal, were used as standards of weight. When the standard was selected, if it was desired to ascertain the specific gravity or weight of any given article, all that was necessary was to put it into one of the scales of the balance, and as many cubes or parts of cubes on the other as might be necessary to counterpoise it. Weights have, however, been frequently derived from grains of corn. Hence in this, and in some other European countries, the lowest denomination of weight is a *grain*; and 32 of these grains are directed, by the ancient statute called *Compositio Mensurarum*, to compose a pennyweight, whereof 20 make an ounce, 12 ounces a pound, and so upward.

In every country in which commercial transactions are extensively carried on, the importance of having weights and measures determined by some fixed standard becomes obvious to every one. But as the size of different parts of the human body differs in different individuals, it is necessary to select some durable article

—a metallic rod, for example—of the length of an ordinary cubit, foot, etc., and to make it a standard with which all the other cubits, feet, etc., used in mensuration shall correspond. These standards have always been preserved with the greatest care: at Rome they were kept in the temple of Jupiter, and among the Jews their custody was intrusted to the family of Aaron.—**PAUCTON**, *Métrologie*, p. 223. The principal standards used in the ancient world were the cubit of the Jews, from which their other measures of length, capacity, and weight were derived; and the foot of the Greeks and Romans. In England, ancient historians tell us that a new, or rather a revived, standard of lineal measure was introduced by Henry I., who ordered that the *ulna*, or ancient ell, which corresponds to the modern yard, should be made of the exact length of his own arm, and that the other measures of length should be raised upon it. This standard has been maintained, without any sensible variation. In 1742 the Royal Society had a yard made, from a very careful comparison of the standard ells or yards of the reigns of Henry VII. and Elizabeth kept at the Exchequer. In 1758 an exact copy was made of the Royal Society's yard; and this copy having been examined by a committee of the House of Commons, and reported by them to be equal to the standard yard, it was marked as such; and this identical yard is declared, by the act 5 Geo. IV., c. 74, to be the standard of lineal measure in Great Britain.

Uniformity of Weights and Measures.—The confusion and inconvenience attending the use of weights and measures of the same denomination, but of different magnitudes, was early remarked; and there is hardly a country in which efforts have not been made to reduce them to the same uniform system. Numerous efforts have been made having this object in view, and enjoining the use of the same weights and measures, under very severe penalties. But, owing to the inveteracy of ancient customs, and the difficulty of enforcing new regulations, these statutes have always had a very limited influence, and the greatest diversity has continued to prevail, except in lineal measures.—*See article DECIMAL WEIGHTS and MEASURES*, p. 510.

Invariable or Natural Standards.—As the standards adopted in most countries have been in a great degree arbitrary, it has long been the opinion of scientific men that, to construct a more perfect system of weights and measures, some natural and unchangeable basis should be adopted. It has, indeed, been contended that the measures of the ancients were deduced from a basis of this sort; and that the *stadium* always formed an aliquot part of the earth's circumference, that part differing among different nations and authors. But no learning or ingenuity can induce any one to believe what is so obviously incredible. The ancients had no means of determining the earth's circumference with any thing like the accuracy required to render it the great unit of a system of measures; and, what is equally decisive, no ancient author ever makes the slightest allusion to any such standard.

In modern times, however, the idea of seeking for a unit of weight and measure in some unchanging natural object has been practically carried into effect. The standards that have been usually proposed for this object have been some aliquot part of the quadrant of the meridian, or the length of a pendulum vibrating seconds in some given latitude. The standard of the second pendulum has been in so far adopted into the existing system of weights and measures established in Great Britain by the act of 1823, that the length of the standard yard, as compared with that of a pendulum vibrating seconds in the latitude of London, is specified in the act as follows:

"Whereas it has been ascertained by the commissioners appointed by his majesty to inquire into the subject of weights and measures, that the said yard hereby declared to be the imperial standard yard,

when compared with a pendulum vibrating seconds of mean time in the latitude of London, in a vacuum at the level of the sea, is in the proportion of 36 inches to 39 inches and 1393 ten-thousandth parts of an inch; be it therefore enacted and declared, that if at any time hereafter the said imperial standard yard shall be lost, or shall be in any manner destroyed, defaced, or otherwise injured, it shall and may be restored by making, under the direction of the Lord High Treasurer, or the commissioners of his majesty's treasury of the United Kingdom of Great Britain and Ireland, or any three of them for the time being, a new standard yard, bearing the same proportion to such pendulum as aforesaid, as the said imperial standard yard bears to such pendulum."

"The brass Troy pound weight procured by the minister of the United States at London in 1827," was declared by act of Congress, May 19, 1828, to be "the standard Troy pound of the Mint of the United States, conformably to which the coinage thereof shall be regulated." But no direct legislation appears to have taken place in the adoption of any general standards of weights and measures. On the 29th of May, 1830, a resolution passed the Senate directing a comparison to be made, under the authority of the Secretary of the Treasury, of the weights and measures used at the principal custom-houses. This comparison was intrusted to a gentleman in every way qualified to undertake it, the late Professor Hassler, and, as might have been expected, great discrepancies were found to exist. The mean, however, corresponded nearly with the standards, as fixed by the English laws previously to, and at the epoch of, the Declaration of American independence. Measures were then taken by the Secretary of the Treasury to have uniform and accurate weights and measures, and authentic standards, made under the immediate personal superintendence of Mr. Hassler, and supplied to all the custom-houses.

While this was being done, on the 14th June, 1836, a joint resolution of Congress directed the Secretary of the Treasury "to cause a complete set of all the weights and measures adopted as standards, and now either made or in the progress of manufacture, for the use of the several custom-houses, and for other purposes, to be delivered to the governor of each State in the Union, or such person as he may appoint, for the use of the States respectively, to the end that a uniform standard of weights and measures may be established throughout the United States;" and on the 7th July, 1838, a section in the "act (chap. 169) to provide for the support of the Military Academy of the United States" provided "that the Secretary of the Treasury cause to be made, under the superintendence of Mr. Hassler, one standard balance for each state; and, when completed, that he cause them to be delivered to the respective governors for the use of the respective States."

The distribution of these standard balances, weights and measures, to the several States has been in a great measure, if not entirely, accomplished. By an act of the Legislature of Massachusetts, April 23, 1847, chap. 242, it is provided that they shall be hereafter used as the sole authorized public standard of weights and measures of this Commonwealth.

The standards of weights and measures, made in part or in whole under the direction of Mr. Hassler, says Professor Bache, have the following origin:

1. The actual standard of length is a brass scale of 82 inches in length, prepared for the survey of the coast of the United States, by Troughton, of London, and deposited in the office of weights and measures at Washington.

2. The units of capacity measure are the gallon for liquid, and the bushel for dry measure. The gallon is a vessel containing 58372.2 grains (8.3389 lbs. avoirdupois) of the standard pound of distilled water at the temperature of maximum density of water, the vessel

being weighed in air in which the barometer is 30 inches at 62° Fahrenheit.

The bushel is a measure containing 543391.89 standard grains (77.6274 lbs. avoirdupois) of distilled water, at the temperature of maximum density of water, and barometer 30 inches at 62° Fahrenheit.

The gallon is thus the wine gallon of 231 cubic inches nearly, and the bushel the Winchester bushel nearly.

3. The standard of weight was the Troy pound, copied by Captain Kater, in 1827, from the imperial Troy pound, for the United States Mint, and preserved in that establishment. The avoirdupois pound is derived from this; its weight being greater than that of the Troy pound in the proportion of 7000 to 5760; that is, the avoirdupois pound is equal in weight to 7000 grains Troy.

WEIGHT AND MEASURE SYSTEMS OF THE WORLD.

I. AFRICA.—*Abyssinia*.—Weights: 1 rotl or rottolo = 12 wakea = 120 dirhems. Dry Capacity: At Gondar, in the interior, 1 ardeb = 10 madağa; at Masuah, on the Red Sea, 1 ardeb = 24 madağa. The other measures are those of Cairo and Alexandria. There is no knowledge of any local system.

Algeria.—Since the acquisition of this territory by France, the French metrical system is legalized, and may be expected gradually to come into use. As yet, however, the old usances are retained.

Weights: The theory appears to be as follows:

24 carob seed	= 1 mitkal or metical, the weight for gold, etc.
8 mitkal	= 1 wakea or ounce.
27 wakea	= 1 rotl khebir or market pound.
18 wakea	= 1 do. gheddari, for fruits.
16 wakea	= 1 do. attari, for spices.
14½ wakea	= 1 do. feuddi, for silver.
100 of each of these rotl	= 1 quantar or cantaro corresponding.

The values of these denominations in the Dictionary are from reported observations, and fall below what would be derived otherwise by ascending from the actual mitkal. Liquid Capacity is measured by the khoulé and its fractions, $\frac{1}{2}$, $\frac{1}{3}$, $\frac{1}{4}$, etc.; as Dry Capacity, by the saa. Length is measured by two different pic, the Turkish and Arab; the latter of which is used for cloth. Each is subdivided by its rob, or eighth part. There are no itinerary or agrarian measures indigenous.

Cape of Good Hope (Colony).—English standards are legalized and used here. The same may be said, it is supposed, of the British colonies in Senegambia and at Sierra Leone, and the smaller establishments on the Gold Coast, as well as of St. Helena and their other islands in the Atlantic. As for Mauritius, on the other side of the continent, that retains still a considerable admixture of its former French usances.

Canary Islands.—In these islands, the originals of the weights and measures are from Spain; and the variations of the actual standards, which (except in the case of the vana) seem to be in the sense of degradation, are not more than occur in continental Spain itself.

Cape Verd Islands.—This Archipelago, as well as the continental territory under the same Governor-Generalship, uses the weights and measures of Portugal. The same may be said of the Madeira Group under the same domination; of the Portuguese possessions in Angola and Benguela; and of the colonies which dwell on the other ocean, along the coasts of Sofala and Mozambique.

Egypt.—The difference between the weights and measures actually used in Cairo and Alexandria, the principal markets of Egypt, is so small as to indicate a common original. The great variety which has been stated to exist among the cantaros (or quintals), according to the various articles intended to be weighed, is probably the result of carelessness or fraud; nor is it clear, as yet, whether this variety affects the hundred-weight or the unitary pound. It may be supposed that the weights by which the articles of greatest consumption—the necessities of life—are determined, were

the standard from which accident or negligence has deviated. *Weight*: 1 cantaro = 36 oke = 100 rotl = 14400 drachma. The rotl does not appear to be systematically subdivided. The harsela, applied to weighing silk, is evidently the oke, under a special name. *Dry Capacity*: 1 ardeb = 24 rob. *Length*: 1 gasab = 4 derah. The Turkish pic is generally used for cloths; it is very little longer than the derah, but not correlative. *Agrarian*: 400 square gasab = 1 feddan al risach, or unitary acre.

Guinea.—*Weight*: 1 benda = 2 benda-offa = 3 eggeba = $5\frac{1}{2}$ seron = 8 piso or uzan = $10\frac{1}{2}$ quinto = 16 aguiraes = 32 media-tabla = 48 akey. The last denomination, which is the special weight for gold dust, is only theoretically connected here; its actual value as reported is nearly half a grain less than the $\frac{1}{15}$ of the benda.

Liberia.—This Anglo-American negro colony at Cape Mesurado, as well as the independent one of Maryland at Cape Palmas, uses, it may be supposed, standards from the United States.

Morocco.—All the dependencies of this empire, along the western coast of Barbary, use the weights and capacity measures of Spain. There are several indigenous measures of length given in the Dictionary, but they are without uniformity.

Tripoli.—In this appanage of the Turkish empire, as well as in the dependencies of Fezzan and Barca, the weights and measures appear to be of European derivation. *Weights*: 1 cantaro = 100 rotl = 1600 uzan = 12800 termini. The metical, a special weight for gold and silver, has no connection with the others, unless it be derived in theory from an ancient rotl or pound of 12 uzan or ounces. The actual weight is reported as being exactly $\frac{1}{100}$ of the Venetian pound, from which it may have originated. *Liquid Capacity*: The mataro for oil is given by gallons in the Dictionary; from its reported weight compared with the average specific gravity, at ordinary temperatures, of that substance. *Dry Capacity*: 1 cafiso = 20 tiberi.

Tunis.—*Weight*: 1 cantaro = 100 rotl = 1600 uzan = 12800 metical or termini. In this system, where the same denominations appear to be lighter than the Tripolitan, the metical and uzan are specific weights. *Liquid Capacity* is determined by weight. *Dry Capacity*: 1 cafiso = 16 quiba = 192 saha or zah. *Length*: 1 pic (woolen) = $1\frac{1}{5}$ pic (silk) = $1\frac{4}{5}$ pic (linen). But these last proportions appear altogether accidental. In this enumeration, the remaining European settlements, viz., those of France on opposite sides of the continent in Senegambia and the Isle of Bourbon, and those of Denmark and Holland in Guinea and Ashanti, have been omitted; partly because the weights and measures of the mother countries would be naturally accepted among the settlers, but chiefly because of the insignificance in population and trade of the actual establishments. The insular appanages of the Imam of Muscat (viz., Quiloa, Zanzibar, Socotra, etc.), on the eastern side of the continent, are passed over for similar reasons; while the native powers, from Morocco through and around Madagascar, are too uncivilized or too inaccessible, to have or to yield any thing of interest in respect to weights and measures.

II. AMERICA.—This continent, for the present purpose, is best divided (instead of the usual distinctions of North, Central, and South) into Independent and Colonial America.

Brazil.—In this empire the originals of weights and measures are from Portugal; and the actual standards are in general identical, though there are a few variations, both in value and denomination, shown in the Dictionary.

Hayti or San Domingo.—This island, which, in the numerous revolutions of policy that it has undergone, has been recently modified from a republic into a form more absolute, and nominally an empire, retains the impress of its double colonization from Spain and France, as well as in the names of localities—on the

western side French, on the eastern Spanish—as in the weights and measures used there.

Mexico.—Under this republic, as well as under the numerous governments which are continually shifting or springing up in the territories of Central and South America, and which it would require a special and contemporaneous research to signalize and verify, the weights and measures of Spain have been throughout and are still recognized; with only such local variations as other causes, besides the cessation of European control and intercourse with a parent power, might be expected naturally to produce. Of course, this comprehensive field for the influence of the Spanish system does not include vast territories (such as Patagonia, for instance) which, although claimed by foreign or domestic powers, are yet, in fact, domineered over by various indigenous tribes, more or less nomadic and uncivilized. Of systematic weights and measures in those territories, there are none in modern times; and ancient ones (such as in Mexico and Peru), which recent researches have partially systematized, are omitted, as neither certain nor of practical application.

United States of America.—*Weight*: 1 Mint or Troy pound = 12 ounces = 240 pennyweight = 5760 grains; 1 apothecary pound = 12 ounces = 96 drachms = 288 scruples = 5760 grains; 1 commercial pound = 16 ounces = 256 drams = 7000 grains; 1 long ton = 20 cwt. = 80 quarters = 2240 commercial pounds; 1 short ton = 20 cwt. = 2000 commercial pounds. In the actual government standards the ounce Troy is divided decimally, down to the $\frac{1}{10000}$ part. These weights are identical with those of England. In both countries, they repose, in fact, upon actually existing masses of metal (brass) which have been individually declared by law to be the units of the system. In scientific theory, they are supposed to rest upon a permanent and universal law of Nature—the gravitation of distilled water at a certain temperature and under a certain atmospheric pressure. And in this aspect, the origination is with the grains; which must be such that 252,458 of these units, in brass, will be in just equilibrium with a cubic inch of distilled water, when the mercury stands at 30 inches in a barometer, and in a thermometer of Fahrenheit at 62 degrees both for the air and for the water. Unfortunately, the expounders of this theory in England used only the generic term *brass*, and failed to define the specific gravity of the metal to be employed: the consequence of this omission is to leave room for an error of $\frac{1}{100000}$ in every attempt to reproduce or compare the results. This is the *minimum* possible error: the *maximum* would be a function of the difference in specific gravity between the heaviest and lightest brass that can be cast.

Liquid Capacity: 1 gallon = 2 half gallons = 4 quarts = 8 pints = 16 gills. The gill is not among existing standards of public authority, though it is used in commerce. There are other denominations higher than the gallon, such as barrels, hogsheads, pipes, etc.; but these are only *vessels*, not *measures*, and are always gauged and sold by their actual capacity in gallons. The gallon, in fact, is almost exactly equivalent to a cylinder 7 inches in diameter and 6 inches high. In theory, it must contain just 231 cubic inches; and, filled with distilled water at the temperature of maximum density (say 39°·8 Fahr.), weighs, according to the official report, at that temperature and at 30 inches of the barometer, 8·339 commercial or avoirdupois pounds; or more nearly 58372·1754 grains. It is in the temperature only that this unit differs from the former wine gallon of Great Britain. The apothecaries use the same gallon, but divide it differently, as follows: 1 gallon = 8 pints = 128 fluid ounces = 1024 fluid drachms = 61440 minims (or drops) = 231 cubic inches. These are graduated measures; they also use sometimes the following approximate ones from vessels in domestic use: 1 tea-cup = 2 wine glasses = 8 table-spoons = 32 tea-spoons = 4 fluid ounces.

Dry Capacity: 1 bushel = 2 half bushels = 4 pecks = 8 gallons. There are also in this, as in the former measure, higher denominations (barrels, sacks, etc.) known in commerce, whose capacity is intended to be constant. They are, however, always gauged by the bushel. This bushel is the old Winchester bushel of England. In fact, it is a cylinder 18.5 inches in diameter, and 8 inches deep. In theory, it must contain 2150.42 cubic inches; and holds of distilled water, at the temperature of maximum density and at 30 inches of the barometer, 77.6274 commercial or avoirdupois pounds; or more nearly 548391.89 grains.

Length: 1 yard = 3 feet = 36 inches = 432 lines = 5184 seconds = 62208 thirds. In the actual government standards, at the custom-houses, the yard is divided decimally into tenths and hundredths. In the measurement of cloths, muslins, linens, cotton, silk, and in general of what are termed *dry goods*, the yard only is used; subdivided into halves, quarters, eighths, sixteenths, and half sixteenths. This lowest denomination = 1.125 inch. Surveyors and engineers employ neither the yard nor the inch, but use the foot and its decimal divisions. Architects and artificers reckon by the foot and subdivisions as given above. Nevertheless, the most usual and most recent workman's scales bear the foot divided into inches, and eighths and sixteenths of an inch. Mariners measure by cable lengths and fathoms: 1 cable length = 120 fathoms = 240 yards = 720 feet. The unit of length—the yard, upon whose subdivisions all the weights and capacity measures repose for verification—is, in fact, derived from ancient arbitrary standards of England. In theory, the inch—the $\frac{1}{36}$ of the yard—is presumed to be contained 39.13929 times in the length of a pendulum that, in a vacuum and at the level of mid-tide, in the latitude of London, vibrates seconds of mean time.

Itinerary: 1 statute mile = 2 half miles = 4 quarter miles = $7\frac{1}{2}$ cable-lengths = 8 furlongs = 80 chains = 320 perches or poles = 880 fathoms = 1760 yards = 5280 feet = 8000 links = 63360 inches; 1 nautical league = 3 equatorial miles = 8.457875 statute miles. Chains and links are denominations employed by land-surveyors, thus: 1 chain = 4 poles = 66 feet = 100 links.

Agrarian and Superficial: 1 square mile = 640 acres; 1 acre = 4 roods = 10 square chains = 160 square perches = 4840 square yards = 43560 square feet; 1 square yard = 9 square feet = 1296 square inches. Architects and builders reckon 1 square = 100 square feet.

Solid: 1 cubic yard = 27 cubic feet = 46656 cubic inches; 1 cubic foot = 12 reduced feet (plank measure) = 1728 cubic inches; 1 reduced foot (plank measure) = 1 square foot \times 1 inch thick = 144 cubic inches. In practice, all planks and scantlings less than an inch in thickness are reckoned at an inch. 1 perch of masonry = 1 perch ($16\frac{1}{2}$ feet) long \times 1 foot high \times $1\frac{1}{2}$ feet thick = 25 cubic feet. In fact, the dimensions given for the perch do not result in 25 cubic feet; but this last number has been adopted for convenience. 1 cord of fire-wood = 8 feet long \times 4 feet high \times 4 feet deep = 128 cubic feet.

Danish Possessions.—These include Greenland, Iceland, and three of the Leeward Islands in the West Indies; viz., Santa Cruz or St. Croix, St. Thomas, and St. John. In all these the weights and measures of Denmark prevail, though in the islands the English length measures are also used.

Dutch Possessions.—Holland holds on the continent of America, the government of Surinam, which includes nominally a territory of something less than 40,000 square miles, under the name of Dutch Guiana; on the coast of Venezuela, the islands of Curaçoa and Bonaire, with some lesser islets; and among the Leeward Antilles, St. Eustatius, the south part of St. Martin, and Saba. In all these, the weights and measures of Holland prevail; except in Curaçoa, where the weights are, in fact, and the length measures, both in fact and name, those of Spain.

English Possessions.—Over the immense territories of British North America the weights and measures of England are legalized; but in Lower Canada the French settlers still use their former denominations to a great extent.

In the southern peninsula, where the general name of English Guiana covers the former Dutch colonies of Berbice, Demerara, and Essequibo, the reckoning is by the weights and measures of Holland.

The settlements in Patagonia and the adjoining Archipelago, made chiefly with a view to the whaling, recognize the English standards. And as much may be said for the Falkland Isles.

Of the numerous islands and islets in the West Indies, among the Antilles and Lucayas, only the chief ones need be mentioned. The weights and measures of a few are still traceable to the source of their earlier colonization.

In the following islands the English weights and measures are used: Antigua, the Bahamas, Barbadoes, Barbuda, St. Christopher's or St. Kitts, Dominica, Grenada, Jamaica, St. Lucia (French), Montserrat, Nevis, Tobago, Tortola, Trinidad (Spanish), and St. Vincent.

In the Bermuda Group, English weights and measures are employed. All these English measures are those before the change in 1825. It would be, therefore, more literal to say, weights and measures of the United States.

French Possessions.—France holds on the continent only what used in part to be Cayenne, and is now on the maps as French Guiana; and among the West India islands, Martinique, Guadeloupe with its dependencies, Desadea or Desirade, Marie-galante, and the group of Les Saintes, together with about two-thirds (on the northern side) of St. Martin.

In Guiana, the new metrical system is legalized; but the older one continues to be used.

St. Martin reckons by the weights and measures of Holland, and Les Saintes by those of England.

The others employ the old French system, with some modifications. Thus the former English wine gallon seems to be the standard for liquids, divided as follows: 1 gallon = 2 pots = 4 pintes = 8 chopines = 16 roquilles = 32 muges; of agrarian measure, 1 carré = 10,000 paces carrés. Besides these, France owns the isles of St. Pierre and Miquelon, to the south of Newfoundland, where the old system prevails.

Russian Possessions.—The extensive territories which Russia holds in the northwest corner of America across Behring's Straits are, it may be supposed, under the domain of Russian customary measures. The establishment which that empire had for nearly forty years in Upper California, at Bodega, has been some time since abandoned.

Spanish Possessions.—The magnificent appanage, continental and insular, which Spain formerly held in America has now dwindled to the islands of Cuba and Porto Rico, where the weights and measures are still those of Spain.

Swedish Possessions.—The only territory of Sweden is the small island of St. Bartholomew or St. Bart's; which, though originally colonized from France, has been so long ceded (now nearly seventy years) as to have adopted Swedish weights and measures.

III. ASIA.—*An-nam*.—Weights: 1 quan = 5 ta = 10 binh = 50 yen = 500 cân; 1 cân (or pound) = 1.6 nen = 16 luong = 160 dong = 1600 ly. From the ly, the subdivisions are regularly decimal; viz., the hao, hot, châu, huy, tran, and ai, which last is the atom or millionth part of the ly. The most of these are purely theoretical, for the hao is itself only 0.06 of a grain, very nearly.

Capacity: In these there is no uniformity nor authenticity, each province using different measures. In Hué there appears to be the following theoretical system: 1 hoc = 10 dau = 100 thang = 1000 hap = 10000

thuoc; 1 thuoc=1200 grains of millet=10 sao; 1 sao (or a handful)=120 grains of millet; and 1 toat=250 grains of millet. The division of the thuoc into 10 sao and 4·6875 toat would seem to indicate two different systems; but as the Tonquin millet and our own are not of the same size, we have no standard of comparison or determination.

Length: There are two thuoc, or cubits; one for general use, the other, which is $\frac{1}{2}$ longer than the former, exclusively for cloths, silks, and other woven fabrics. 1. Mercers'.—1 gon=10 that=30 truong=300 thuoc; 1 thuoc (or ell)=10 tac=100 phan=1000 ly. 2. Builders', etc.—1 mau=10 sao=30 ngu=150 thuoc; 1 thuoc (or cubit)=10 tac=100 phan=1000 ly.

Agrarian: This last series is also used by land-measurers in giving the square content of land. They sometimes use another series (called *ruong luc*, in contradistinction to the *ruong ngu*, just given), in which the sao is equal to $16\frac{1}{2}$ thuoc. The mau is, therefore, 10 per cent. longer in this last series; and its superficial content, when squared, 21 per cent. greater.

Itinerary: These are very vague and only approximate: 1 dam=2 ly=rather less than half a mile.

Birmah.—*Weight:* 1 vis=3 catty=100 tical. *Length:* 1 bambou=28 taim=504 palgat. *Itinerary:* 1 taing=250 bambou=7000 taim. But these are by no means certain.

China.—*Weight:* Almost every thing in China (timber, liquids, live stock, etc.) is sold by weight, actual or nominal. 1 shik= $1\frac{1}{2}$ tam=4 kwan=60 yin=120 kan or catty; 1 kan=16 leung or tael=364 chu=3840 lui=38400 shu, or kernels of grain. The weights above the yin are only nominal and for account; and those below the tael are generally denoted by the adjuncts *li*, *ho*, *tsin*, *fat*, etc., i. e., one tenth, one hundredth, one thousandth, etc.

Capacity: This is regulated, as before said, by weight; the existing *dry measures*, which have been adopted for the convenience of commerce for grain and seeds, vary considerably in consequence of the irregularity of the material (bamboo) of which they are made. The theory is supposed to be as follows: 1 ping=5 yu=16 hok=32 shik=80 tau; 1 tau=10 shing=100 kop=200 yeuk=1000 cheuk=10000 chau=100000 tsut=1000000 kwai=6000000 suk, or grains of maize. Of all these, there are only four actual measures; viz., the tau, the shing, the half-shing, and the kop. These are also upon two different modules, distinguished by the adjuncts *shi* and *tsong*; and in proportionate capacity as 100 to 65 respectively. It may be supposed that the latter were intended for *liquid measures*; and their average contents are so reduced accordingly in the Dictionary.

Length: 1 yan=10 cheung=100 chik=1000 tsun=10000 fan. The chik, fixed by the Mathematical Board at Pekin=13·125 inches; used by tradesmen in Canton=14·625 to 14·81 inches; employed by engineers of public works=12·7 inches; and that by which distances are usually measured=12·1 inches.

Itinerary: 1 to=25 fan=125 tsun=250 li or miles; 1 li=1826 English feet. This is the count since the intervention of European mathematicians at Pekin. The former used to be 1 to=192 $\frac{1}{2}$ li=79300 po=396500 chik; 1 li=1897 $\frac{1}{2}$ English feet. Some ambiguity arises from the use of the same word, li (probably from European ignorance of the language in not discriminating between similar but not identical terms), as a lower measure, the $\frac{1}{10}$ of the fan. The same ambiguity extends itself also to the following series.

Agrarian: 1 king=100 mau=400 kok=1000 fan=24000 po. But these are so uncertain that they have not been given.

Solid Measures are products of the cheung, which is generally in this series 14·6 English feet.

Hindustan.—The weights and measures of the indigenous governments of this vast country (such as, for instance, Sindh, Nepaul, and the confederated

Sikhs, etc.), are either too little known or too uncertain to admit of any system. All that will be done is to give the relations of the principal measures in common use, where European domination prevails or European commerce has established itself.

British Possessions: Bombay.—*Weight:* 1 candy=20 maunds or maons=800 seer=24000 pica. *Dry Capacity:* 1 candy=8 para=128 adoulie. *Calcutta.*—*Weight:* 1 maon or maund=40 seer=640 chattac=3200 sicca. *Dry Capacity:* 1 pallie=4 raik=64 khoonké=320 chattac. *Length:* 1 haut or coid=8 gheria=72 jacob. *Itinerary:* 1 coss=4000 haut. *Agrarian:* 1 biggah=20 cottah=320 chattack=6400 square coid. The chattack is, in fact, a surface 5 coid in length by 4 coid in width. *Madras.*—*Weight:* 1 garcé=20 candy or barauy=400 maund or maon=3200 visay; 1 visay=40 pollam=400 varahun. *Dry Capacity:* 1 garcé=80 para=400 marcal=3200 puddy=25600 ollock. *Liquid Capacity*, like the dry, is determined by weight; and the denominations are the same as in the latter. *Agrarian:* 1 casseney=24 maony=240 square coid.

Danish Possessions: Serampore and Tranquebar.—The weights and measures here are legally those of Denmark, and by custom those of Calcutta and Madras respectively.

French Possessions: Pondichéry.—The colonial denominations and divisions are identical with those of Madras, although the values are different.

Portuguese Possessions: Goa.—Here Portuguese weights and measures are employed.

Japan.—*Weight:* 1 picul=100 catty=1600 tael=16000 mas=160000 condorine. The connection of the other measures is not known.

Ottoman Asia: Aleppo, Smyrna, etc.—The weights and measures here are so variant, or are rather so mixed up with the units and values of foreign commerce, as not to admit of satisfactory classification.

Persia.—*Weight:* 1 batman=6 ratel=300 dirhem=600 mascais. This is the batman of Tauris; that of Shiraz, which is twice the value; appears properly to be part of the same system. The other measures are unsystematic.

Siam.—*Weight:* 1 picul=100 catty=2000 tael=8000 tical. *Dry Capacity:* 1 cohi=40 cesti=1600 sat. *Length:* 1 vouah=2 ken=sok. *Itinerary:* 1 roéneng=2000 vovah.

IV. EUROPE.—*Austrian Empire: Vienna.*—*Weight:* 1 pfund=2 mark=4 vierling or vierding=16 unze=32 loth=128 quent=512 pfennig. Apothecaries: 1 pfund= $1\frac{1}{2}$ mark=12 unze=96 drachma=288 scrupel=5760 gran. The mark is identical in both series, and is the unit of gold and silver weight. 1 centner=5 stein=100 pfund. *Liquid Capacity:* 1 fuder=82 eimer=128 viertel=1312 (imperial) mass; 1 mass=2 kanne=4 seidel=8 pfiff. *Dry Capacity:* 1 muth=80 metze=120 viertel=240 achtel; 1 achtel=2 mühl-massel=8 futtermassel=16 becher=128 probmetze. *Length:* 1 klafter=6 fuss=72 zoll=864 linie=10368 punkt. *Itinerary:* 1 meile=4000 klafter=24000 fuss. *Agrarian:* 1 joch or jochart=3 metze=576 square ruthe=1600 square klafter=57600 square fuss. *Prague.*—*Weight:* 1 centner=6 stein=120 pfund. The lower subdivisions are as in Vienna; but their values, as well as of the terms just given, correspond with a lighter pound than the imperial standard. *Liquid Capacity:* 1 fass=4 eimer=128 pinte=512 seidel. *Dry Capacity:* 1 strich=4 viertel=16 massel=192 seidel. *Agrarian:* 1 joch of Vienna=2 strich.

Venetian Lombardy: Milan.—*Weight:* Peso grosso: 1 libbra=4 quarto=28 oncia. Peso sottile: 1 libbra=12 oncia=288 denaro=6912 grano. Gold and silver are by the marco, subdivided as follows: 1 marco=8 oncia=192 denaro=4608 grano. Apothecary: 1 libbra peso sottile=12 oncia=96 drachma=288 scrupolo=6912 grano. In 1803 the French kilogram, with decimal subdivisions, was introduced; which is the

new Italian pound or metrical pound of the Dictionary. 1 rubbio=10 libbra metrica=100 oncia=1000 grosso=10000 denaro=100000 grano. *Liquid Capacity:* 1 brenta=3 staja=6 mina=12 quartaro=16 bassa=48 pinta=96 boccale. *Dry Capacity:* 1 moggio=8 stajo=16 starello=32 quartaro=128 meta=512 quartino. In the new metrical system capacity is reckoned as follows: 1 soma=10 mina=100 pinta=1000 coppo. *Length:* 1 braccio=12 oncia=144 punto=1728 atomo. New measure in 1803: 1 metro or braccio=10 palmo=100 dito=1000 atomo. *Itinerary* since 1803: 1 miglio=1000 metro. The old mile of Milan is not correlative; but appears, in theory, to be equivalent to 3000 braccio. *Agrarian:* 1 pertica=24 tavola=96 square cavezzo=3456 square piede. The *piede*, or foot, used here is not employed in any other part of the system. It seems to have been originally $\frac{1}{2}$ of the braccio. Since 1823: 1 tornatura=100 square palmo. The tornatura is identical with the French *are*. *Venice.*—*Weight:* *Peso grosso:* 1 libbra=2 marco=12 oncia=72 saggio=2304 carato=9216 grano. *Peso sottile:* 1 libbra=12 oncia=72 saggio=1728 carato=6912 grano. The *peso grosso* is used in general commerce; the *marco* and its subdivisions are for gold and silver and precious stones; the *peso sottile* for drugs, colors, coffee, tea, sugar, silk, rice, and butter. This last is estimated at $\frac{1}{16}$ of the former. When used for medicines, it is subdivided as the Austrian apothecary pound. *Liquid Capacity:* 1 anfora=4 bigonzio=8 concia or mastello=48 secchio=192 bozza=512 boccale=768 quartuccio; 1 botta=5 bigonzio. *Dry Capacity:* 1 moggio=4 stajo or staro=16 quarto=64 quartarolo. *Length:* 1 braccio=2 piede. This braccio is for woollens, etc.; that for silk is shorter. *Itinerary:* 1 miglio=1000 passo=6000 piede. *Agrarian:* 1 campo=640 tavola, or square pertica, or square cavezzo=25920 square piede. New measure: 1 migliajo=1000 square passo=25000 square piede. The metrical weights and measures, described under Milan, are also employed here as there in all governmental transactions. Otherwise the local measures are still in use. In the other parts of the Austrian dominions, such as Dalmatia, Hungary, Moravia, etc., local systems, if they ever existed, are now only discernible in the names and values of a few disconnected and apparently arbitrary measures.

Baden.—*Weight:* Old measure: 1 pfund=32 loth=128 quentchen. New measure: 1 pfund=10 zehning=100 centass=1000 pfennig=10000 ass. The new measure was established in 1810, when the value of the *pfund* was taken at $\frac{1}{2}$ kilogram, and a decimal division adopted; but the old division is still retained, and is applied both to the old unit and to the new. The mark of Cologne is employed for gold and silver; and the value and subdivisions of the Nürnberg apothecary pound for drugs and medicines. *Liquid Capacity:* 1 fuder=10 ohm=100 stütze=1000 mass=10000 glas; 1 ohm=15 decalites of France. *Dry Capacity:* 1 zuber=100 malter=100 sester=1000 müsslein=10000 becher; 1 sester=15 decalites of France. *Length:* 1 ruthe=10 fuss=100 zoll=1000 linie=10000 punkt; 1 ruthe=3 mètres of France. The old fuss was 3 per cent. shorter, but has been merged into the new one. *Itinerary:* 1 meile=2 stunden=8 $\frac{1}{2}$ kilometres of France. *Agrarian:* 1 morgen=4 viertel or quart=400 square ruthe=40000 square fuss. *Solid:* 1 klaffer, for fire-wood=6 feet long×6 feet high×6 feet deep=128 cubic fuss. What is here called deep signifies in every case the length of the billet or log.

Bavaria.—*Weight:* 1 pfund=16 unze=32 loth=128 quentchen. A uniform value was established for the unit in 1811, corresponding with the new French weight. The apothecary pound was at the same time defined at $\frac{3}{16}$ of the unit, and is divided like the Nürnberg apothecary pound. Gold and silver are by the mark of Cologne. *Liquid Capacity:* 1 eimer=60 masskanne=240 quartel. *Dry Capacity:* 1 scheffel=6

metze=12 viertel=48 massel or achtel=96 müsslein=192 dreissiger; 1 scheffel=208 liquid masskanne, in actual content. *Length:* 1 fuss=12 zoll=144 linie=1728 punkt. This unit was established in 1809, and defined in terms of the old French measure, at 129.58 *lignes* of Paris. The near approach of this value to 3 décimètres in the new French system allows the *fuss*, as is frequently done, to be decimally divided. Thus the *elle* of Rhenish Bavaria is 4 fuss of this count, or 12 décimètres of France. The legal *elle* is 2 fuss 10 $\frac{1}{2}$ zoll of the legal value above. *Itinerary:* 1 meile=2400 ruthe=24000 fuss; 1 meile of Anspach=2 stunde=2880 ruthe=28800 fuss. *Agrarian:* 1 juchart, morgen, or tagwerk=400 square ruthe=40000 square fuss. *Solid:* 1 klaffer, for fire-wood=6 feet long×6 feet high×3 $\frac{1}{2}$ feet deep=126 cubic fuss. In Rhenish Bavaria generally, the billets are 4 feet long, which makes the klaffer=144 cubic fuss. *Augsburg: Nürnberg.*—The denominations and values of local measures retained in both of these places, and elsewhere in Bavaria, are given in the Dictionary. The apothecary weight of Nürnberg, which is general over all Germany for medicines (as the mark of Cologne is for specie), is $\frac{1}{2}$ of the old Nürnberg money pound, which last is divided as follows: 1 pfund=2 mark=16 unze=16 loth=128 quart=512 pfennig=8220 as-ducat. The apothecary pound, as under: 1 pfund=12 unze=96 drachma=228 scrupel=576 obolus or heller=5760 gran.

Belgium.—*Weight:* Old measure of Brussels. Commercial: 1 livre or pond=4 quarteron=16 once=64 satin=128 gros=9216 grains. Specie: 1 livre or pond=2 mark=16 once=320 esterlin=1280 felins=10240 as=1 pond Troy of Holland. The new weight is the kilogram and its decimal subdivisions, established since 1816. The apothecaries' unitary pound, subdivided like that of Nürnberg, is, since 1817, $\frac{2}{3}$ of the kilogram of France; but in this respect there is not entire uniformity. The other measures are all in value corresponding with the metrical system of France, and decimally subdivided. Thus the unit for liquids (the *vat*) and that for dry (the *mudde*) are each=100 litres of France. The unitary *el* or *aune*=1 mètre; the agrarian unit (the *vierkantebunder*)=1 are of France, or nearly 4 square perches English; the metrical *mil* or mile=1 kilomètre. Other terms remaining from the old systems, but now disconnected, are given in the Dictionary.

Bremen.—*Weight:* 1 pfund=2 mark=16 unze=32 loth=128 quentchen=512 ort=498.69 grammes of France, since 1818. There is another pfund used in retail commerce, which is 6 per cent. lighter than the standard. Gold and silver are weighed by the mark of Cologne, and medicines by the apothecary pound of Nürnberg. 1 schiffpfund=20 liespfund=290 pfund; 1 frachtpfund or pfundschwer=300 pfund; 1 centner=116 pfund. *Liquid Capacity:* 1 fuder=4 oxhoft=6 ohm=24 anker=120 viertel=270 stübchen=1080 quartier=4320 mingel. *Dry Capacity:* 1 scheffel=4 viertel=16 pint. *Length:* 1 elle=2 fuss=24 zoll=240 linie. Surveyors divide the fuss decimally. *Itinerary:* 1 ruthe=2 $\frac{1}{2}$ klaffer=8 elle=16 fuss. The usual meile contains 20000 Rhenish feet. *Agrarian:* 1 morgen=120 square ruthe=30720 square fuss. *Solid:* 1 faden=6 feet long×6 feet high×2 feet deep=72 cubic fuss. Fire-wood is also sometimes measured by the *reep* or *reif*, a circular pile 17 $\frac{1}{2}$ fuss in circumference, the billets varying from 4 $\frac{1}{2}$ to 6 fuss in length. The *reif* yields from 1 to 2 faden, accordingly.

Brunswick.—*Weight:* 1 pfund=2 mark=32 loth=128 quentchen=512 pfennig=1024 heller; 1 schiffpfund=20 liespfund=280 pfund. Gold and silver by the mark of Cologne, medicines by the apothecary pound of Nürnberg. 1 fuder=4 oxhoft=6 ohm=240 stübchen=960 quartier=1920 nössel; 1 fass of beer=4 tonne=108 stübchen=432 quartier=864 nössel; 1 fass of mum=100 stübchen=400 quartier=900 nössel. *Dry Capacity:* 1 scheffel=10 himt=40 vierfass=160

becher or löcher. *Length*: 1 elle=2 schuh=24 zoll. *Itinerary*: 1 ruthe=8 elle=16 schuh. The usual meile contains 34424 Rhenish feet. *Agrarian*: 1 morgen=120 square ruthe=30720 square schuh.

Cracow.—*Weight*: 1 funt=2 mark=48 skoyciec. Apothecary weight is that of Nürnberg. *Liquid Capacity*: 1 stangiew=2 becška=72 garniec=28 kwart. *Dry Capacity*: 1 korzec=2 polkorzow=4 cwierc=32 garcy or garniec. *Length*: 1 stopa=12 calow=144 linow=1728 punkt. The other measures are those of Poland.

Denmark.—*Weight*: 1 pund=2 mark=16 unze=32 lod=128 quintin=512 ort; 62 pund=weight of 1 cubic fod of rain-water at 16½° centigrade. Gold and silver is weighed by a pund nearly 6 per cent. lighter than, but not aliquot with, the commercial pund, and is subdivided like this last, only more minutely, into 8192 as=65536 gran. The royal Mint, however, uses the mark of Cologne. Apothecaries' weight is that of Nürnberg. 1 last=16½ skippund=144½ waag=325 lispond=433½ bismerspund=5200 pund; 1 skippund=20 lispond=320 pund. *Liquid Capacity*: 1 aam=4 anker=20 viertel=40 stübchen=77½ kande=155 pot=620 pägel. *Dry Capacity*: 1 toende=4 fjerding=8 skieppe=32 fjerdingkar=144 pot. *Length*: 1 aln=2 fod=24 tomme=288 linie. The fod represents $\frac{1}{38}$ of the pendulum beating seconds, in a vacuum, at the level of the sea, under the mean parallel of 45° north latitude. *Itinerary*: 1 mill=2400 rode=4000 favn=12900 aln=24000 fod. *Agrarian*: 1 pfug=8 toende (hartkorn)=32 toende (sädeland)=64 skieppe=256 fjerdingkar=768 album=3072 penge=17920 square rode=1792000 square fod. The measures of Holstein are chiefly those of Hamburg, and those of Norway differ only locally, not systematically, from the Danish.

France.—*Weight*: 1 kilogram=100 hectogram=100 decagram=1000 gram=10000 decigram=100000 centigram=1000000 milligram. The unit, or kilogram, is the weight of a cubic decimetre of distilled water at the temperature of maximum density, taken at 4° centigrade, or 39°·2 Fahrenheit. 1 tonneau=10 quintal=100 myriagrams=1000 kilograms. Apothecary weight has not been so symmetrically and uniformly constructed. In the French pharmaceutical Codex, the *gramme* has been adopted as the key of the system, and is considered as equivalent to $\frac{1}{4}$ of the old *drachme*. The *once*, habitually of 8 drachmes, is then 32 grams. But as this number is irrational with a decimal division, a compromise has been made as follows: 1. 1 double livre (kilogram)=2 livre=4 demi-livre=8 quarterons (of 4 onces)=1000 grams. 2. 1 once=8 gros, or drachme=640 grain=1280 demi-grain=32 grams, instead of 31½ grams, as it must have been, if the same binary division had been carried through.

Liquid and Dry Capacity: 1 kilolitre=10 hectolitre=100 decalitre=1000 litre=10000 decilitre=100000 centilitre=1000000 millilitre. The unit or litre is the cubic decimetre; the kilolitre is therefore a cubic metre. The myrialitre=10 kilolitre.

Length and Distance: 1 myriametre=10 kilometre=100 hectometre=1000 decametre=10000 metre=100000 decimetre=1000000 centimetre=10000000 millimetre. The metre, or unit, is assumed to be the ten-millionth of the quadrant, or the forty-millionth of the whole circumference of the globe, measured over the poles. The actual value assigned to it, in spite of the pains taken in the geodetical and artistical operations, is, after all, owing to the nature of the very operations, to be considered as only a near approximation. The provisional metre of 1795 is, in fact (as more recent investigations show), nearer the most probable value aimed at than the one adopted in the law of 1799. But the utmost error is only about $\frac{1}{500}$ of the length, or absolutely less than $\frac{1}{5000}$ of an inch.

Agrarian: 1 hectare=100 are=10000 centiare or square metres. This part of the system admits the

same decimal multiplication and subdivisions as the others in theory; but, in point of fact, the intermediate terms have been rejected.

Solid: 1 decastere=10 sters=100 decistere. The sters is the cubic metre; and its content, therefore, is the same as the capacity of the kilolitre. The terms given are all that are retained in the nomenclature. The names even of the old measures of France having been interdicted since 1840 by law, their relations and combinations are of no remaining practical interest. The terms and values will be found in the Dictionary.

Frankfort.—*Weight*: 1 pfund=2 mark=16 unze=32 loth=128 quentchen=512 pfennig=1024 heller. There is also a commercial pound for retail, called *silber-pfund*, about 8 per cent. lighter than the former, but similarly divided. Flour and malt are weighed by a pound of 32½ loth *silber-pfund*, meat and butter by 33 loth of the same system, and fish by one of 35 loth. Gold and silver are reckoned by Cologne weight, and drugs and medicines by the apothecary pound of Nürnberg. *Liquid Capacity*: 1 fuder=6 ohm=120 viertel=480 eich-mass=540 neu-mass; 1 mass=4 schoppen. *Dry Capacity*: 1 malter or achtel=4 simmer=8 metze=16 sechter=64 gescheid=256 mäschen or viertel=1024 schrott. A malter of wheat weighs from 175 to 190 lbs. flour weight; rye, 165 to 480 lbs. flour weight; barley, 150 to 165 lbs. flour weight; oats, 95 to 110 lbs. flour weight; flour, 143 lbs. flour weight. This includes the tare of the sack, which is reckoned at 3 flour pounds. *Length*: 1 werkschuh=12 zoll=144 linie; 1 ruthe=12½ werkschuh=10 feldfuss=100 zoll=1000 linie. *Agrarian*: 1 hufe=80 morgen=4800 square ruthe=480000 square feldfuss. *Solid*, for fire-wood: 1 klafter=6 W. long×7 W. high×3 W. deep=126 cubic werkschuh; 1 stecken=8½ werkschuh, cubed=49½ cubic werkschuh.

Great Britain.—The imperial standards adopted since 1825 altered only the value of the capacity measures. The weights and the long, agrarian, and solid measures are identical with those of the United States. Capacity measures are the same, both for liquids and things dry. The origination of these is with the *gallon*, which contains 10 pounds avoirdupois of distilled water at 30 inches of the barometer and 62° Fahrenheit both for the air and the water. Eight of such gallons make the bushel. The old subdivisions and nomenclature, as far as applicable, are retained.

Weight: Troy and apothecary have been given under the head UNITED STATES. Avoirdupois: 1 ton=20 hundred-weight=80 quarter=2240 pound=35840 ounce=573440 dram. Wool: 1 last=12 sack=24 vey=156 tod=812 stone=624 clove=4368 pound.

Liquid Capacity: Old wine measure: 1 tun=2 pipe=3 puncheon=4 hogshead=6 tierce=8 quarter-casks=252 gallon=1008 quart=2016 pint. Old beer measure: 1 butt=1½ puncheon=2 hogshead=3 barrel=6 kilderkin=12 firkin=108 gallon. Ale measure was the same as to the gallon and its subdivisions; but the firkin of ale was only 8 gallons, and the hogshead of ale 48 gallons, instead of 9 and 54 gallons respectively.

Dry Capacity: Old measure: 1 last=2 wey=10 quarter=20 coom=80 bushel=320 peck=640 gallons=5120 pint.

Length: 1 yard=3 feet=36 inches=108 barley-corn=432 line. Cloth measure: 1 French ell=1½ English ell=1½ yard=2 Flemish ell=6 quarters=27 nail=54 inch.

Hamburg.—*Weight*: 1 pfund=2 mark=16 unze=32 loth=128 quentchen=512 pfennig. Gold and silver are weighed by the mark of Cologne, and medicine by Nürnberg apothecary weight. 1 schiffpfund=2½ center=20 liespfund=280 pfund. This is sea freight; wagon weight is also called schiffpfund, but=320 pfund. *Liquid Capacity*: 1 fuder=4 oxhoft=5 tonne=6 ahm=24 anker=30 eimer=120 viertel=240 stübchen=480 kanne=960 quartier=1920 ossel; 1 fass, for whale-oil=1½ tonne=7½ stechkanne=120

margel=160 quartier. *Dry Capacity*: 1 last, for wheat and grain generally; and seeds=3 wispel=30 scheffel=60 fass=120 himt=480 spint; 1 stock, for oats and barley=1½ last, and similarly subdivided. The scheffel is hardly used; the fass is the principal measure. The indications of the steelyard used for weighing grain, and quoted in the *Price Current*, is upon 1½ fass of such grain respectively. The established weight of the fass is: of barley, 68 pfund; beans, 108 pfund; oats, 52 pfund; peas, 100 pfund; rye, 81 pfund; wheat, 86 pfund. *Length*: 1 elle=2 fuss=24 zoll=192 achtel. Ship-builders, for the measurement of spars, etc., divide the fuss into 3 palm. Engineers and surveyors use the Rhenish foot and inch, decimally divided. *Itinerary*: 1 meile=200 ruthe=24000 Rhenish fuss. *Agrarian*: There are two ruthe or perches in land measure, the marschruthe equal to 7 ell, and the geestruthe to 8 ell. Of course, 1 square geestruthe=13³/₈ marschruthe=256 square fuss; 1 morgen=600 square marschruthe=117600 square fuss. *Solid*: 1 klafter or faden=6³/₈ F. long × 6³/₈ F. high × 2 F. deep=88³/₈ cubic fuss; 1 messbergerfaden=6³/₈ F. long × 8 F. high × 2 F. deep=106³/₈ cubic fuss.

Manöver.—*Weight*: 1 pfund=2 mark=16 unze=32 loth=128 quentchen=512 örtchen. Gold and silver are weighed by the mark of Cologne. The apothecary pound is $\frac{3}{4}$ of the commercial pfund, subdivided like that of Nürnberg, which last is itself frequently used. *Liquid Capacity*: 1 fuder=4 oxhoft=6 ahm=15 eimer=24 anker=120 viertel=240 stübchen=480 kanne=960 quartier=1920 nössel; 1 fass for beer=4 tonne=104 stübchen=208 kanne=416 quartier. *Dry Capacity*: 1 last=2 wispel=16 malter=96 himt=288 drittel=384 vierfass. *Length*: 1 elle=2 fuss=24 zoll=192 achtel=288 linie. *Itinerary*: 1 meile (since 1818)=1462³/₈ ruthe=11700 elle=25400 fuss. The old or polizei-meile was 2274 ruthe. *Agrarian*: 1 morgen of Calenberg=1½ drohn=2 vorling=120 square ruthe=30720 square fuss.

Hesse Cassel.—*Weight*: 1 pfund=16 unze=32 loth=128 quentchen. In retail the pfund of Berlin (which is about 3 per cent. lighter) is employed, subdivided as above. Gold and silver are by the Cologne; medicine, etc., by the Nürnberg weight. *Liquid Capacity*: 1 fuder=6 ohm=120 viertel=480 mass=1920 schoppen. *Dry Capacity*: 1 scheffel=2 himt=8 metze=32 mäschen. *Length*: 1 waldfuss or standard=12 zoll=144 linie. *Itinerary*: 1 ruthe=7 elle=14 landfuss, or surveyors' foot. The ruthe is sometimes divided decimally into 10 fuss, etc. *Agrarian*: 1 acker=150 square ruthe=29400 square landfuss. *Solid*: 1 klafter=5 F. long × 5 F. high × 6 F. deep=150 cubic waldfuss.

Hesse-Darmstadt.—The old weights and measures were those of Frankfurt. Those established in 1821 are as follows: *Weight*: 1 pfund=32 loth=128 quentchen=512 richtpfennig= $\frac{1}{2}$ kilogram of France. Gold and silver are still reckoned by the mark of Cologne, and Nürnberg furnishes the apothecary weight. *Liquid Capacity*: 1 fuder=6 ohm=120 viertel=480 mass=1920 schoppen. The schoppen= $\frac{1}{2}$ litre of France. *Dry Capacity*: 1 malter=4 simmer=16 kümpf=64 gescheid=256 mäschen=128 litre of France. *Length*: 1 klafter=10 fuss=100 zoll=1000 linie. The fuss is $\frac{1}{2}$ metre of France; the elle is $\frac{2}{3}$ metre. *Agrarian*: 1 morgen=4 viertel=400 square klafter=40000 square fuss. *Solid*: 1 stecken=5 F. long × 5 F. high × 4 F. deep=100 cubic fuss. The old stecken was 6 × 6 × 4=144 cubic feet, old measure.

Holland.—Since 1817 the values and divisions of the weights and measures have been according to the metrical system of France, retaining more or less of the old nomenclature, as will be found under that head.

Ionian Isles.—Since 1817, when the new Constitution of these isles was ratified by the English Parliament, the standard weights and measures have been those of Great Britain. There still remain, however, several

detached usances of Turkish and Venetian origin, which will be found under their proper heads.

Lübeck.—*Weight*: 1 pfund=2 mark=16 unze=32 loth=128 quentchen=512 pfennig. Gold and silver weight is that of Cologne; apothecary weight of Nürnberg. The schiffpfund and tonne are divided as at Hamburg. *Liquid Capacity*: 1 fuder=4 oxhoft=6 ahm=24 anker=30 eimer=120 viertel=240 stübchen=480 kanne=960 quartier=1920 plank=3840 ort. *Dry Capacity*: 1 last=8 drömt=24 tonne=96 scheffel=384 fass. *Length*: 1 elle=2 fuss=24 zoll=144 linie=1728 punkt. Other usances here are the same as at Hamburg.

Lucca.—The weights and measures of this territory are, in system, the same as those of Tuscany, of which it will hereafter form a part.

Mecklenburg Schwerin.—What is under this will also apply to the other Grand Duchy of Mecklenburg Strelitz, both of whose systems of weights and length measures are those of Hamburg; while the capacity measures are, in fact, those of Lübeck.

Modena.—*Weight*: 1 libbra or lira=12 oncia=192 ferlino; 1 libbra, for gold and silver=12 oncia=96 ottava=192 ferlino=1920 carato=7680 grano. Apothecary: 1 libbra=12 oncia=96 drachma=288 scrupolo=6912 grano. *Liquid Capacity*: 1 barile=20 fiasco=40 boccale. *Dry Capacity*: 1 sacco=2 stajo. *Agrarian*: 1 biolca=72 tavola=288 square cavezzo=10368 square piede. The piede of Reggio has the same relations, but a different value, with that of Modena, the city. The other measures appear arbitrary.

Ottoman Empire, or Turkey in Europe.—Neither our knowledge nor, perhaps, the actual state of weights and measures in this empire, allow of their being arranged in any satisfactory, systematic exhibition; and the same may be said of the modern kingdom of Greece. The value and denominations of isolated units have been given before.

Parma.—*Weight*: 1 libbra=12 oncia=288 denaro=6912 grano. Gold and silver are weighed by the marco of Milan, or by the new Italian pound. The apothecary pound is identical with the commercial libbra. The rubbio is 25 libbra. *Liquid Capacity* is measured as at Milan. *Dry Capacity*: 1 stajo=2 mina=16 quartarole. *Length*: 1 pertica=6 braccio di legno=72 oncia=864 punto=10368 atomo. *Agrarian*: 1 biolca=6 staro=72 tavola=288 square pertica=10368 square braccio.

Portugal.—*Weight*: 1 arratel=2 marco or meo-arratel=4 quarta=16 onça=128 outava=384 escropalo=9216 grao. This weight, from the onça down, answers for all purposes. Gold and silver are reckoned by the marco of 8 onças, and medicines are weighed by a libbra of 12 onças, which is therefore $\frac{2}{3}$ arratel. 1 tonelada=13¹/₂ quintal=54 arroba=1728 arratel. *Liquid Capacity*: 1 almude=2 alqueire or cantaro=12 canada=24 meia-canada=48 quartilho=96 meio-quartilho; 1 tonelada=2 pipa or bota=52 almude=104 alqueire. *Dry Capacity*: 1 moio=15 fanga=60 alqueire=120 meio-alqueire=240 quarto=480 outava=960 maquia or meia-outava. *Length*: 1 covado=3 palmo da craveira=24 pollegada=36 dedo=144 grao=288 linha=3456 ponto. The commercial covado, called *covado avantejado*, has 24¹/₂ pollegadas. *Itinerary*: 1 braça=1¹/₂ passo=2 vara=6³/₈ pe=10 palmo da craveira; 1 legoa=3 milha=24 estadio. *Agrarian*: 1 geira=4840 square vara.

Prussia.—The weights and measures were reformed here in 1816. *Weight*: 1 pfund=2 mark=16 unze=32 loth=128 quentchen. The unitary pfund is $\frac{1}{16}$ of a cubic foot of distilled water, weighed, and reduced to a vacuum at the temperature of 15° Reaumur (65 $\frac{1}{2}$ ° Fahrenheit). Gold and silver are still reckoned by the mark of Cologne, to which the Prussian mark is considered as equivalent; and the apothecary pound, divided like that of Nürnberg, is $\frac{3}{4}$ pfund. 1 schiffpfund=3 centner=15 stein=20 liespfund=330 pfund.

Liquid Capacity: 1 fuder = 6 ohm = 12 eimer = 24 anker = 720 quart = 1440 össel. The eimer contains 3840 cubic zolle or inches. *Dry Capacity:* 1 last, for wheat and rye = 4 wispel = 6 malter = 72 scheffel = 288 viertel = 1152 metze = 4508 müsschen; 1 last, for barley and oats = 48 scheffel. The scheffel is $\frac{1}{2}$ of the eimer in absolute capacity, or 3072 cubic zolle. *Length:* 1 fuss (rheinfuss) = 12 zoll = 144 linie = 1728 scrupel. This unit has been established at 139, 13 lignes de Paris. The elle is $25\frac{1}{2}$ zolle. *Itinerary:* 1 ruthe = 10 landfuss = 12 rheinfuss. The landfuss is also subdivided decimally into 10 zoll = 100 linie = 1000 scrupel; 1 postmeile = 2000 ruthe = 24000 rheinfuss. *Agrarian:* 1 morgen = 180 square ruthe = 25920 square rheinfuss. *Solid:* 1 klafter = 6 F. long \times 6 F. high \times 3 F. deep = 108 cubic rheinfuss; 1 haufen = $4\frac{1}{2}$ klafter = 18 F. long \times 9 F. high \times 3 F. deep = 486 cubic rheinfuss. The old values and denominations which are still retained, as well in the capital as in several principal cities, are given under those heads.

Roman States.—Under this name is intended what has, until recently, been known as the State of the Church. Late events have shown this last title to be uncertain. Two principal cities comprehend all that is systematic in weights and measures. *Bologna.*—*Weight:* 1 libbra = 12 oncia = 96 ottava = 192 ferlino = 1920 carato = 7680 grano. This weight serves also for gold and silver, though the new Italian metrical pound (the kilogram) is also employed, as well as the libbra of Rome. In Ferrara, use is still had of the marco of Milan. *Apothecary:* 1 libbra = 12 oncia = 96 drachma = 288 scrupolo = 6912 grano. This libbra weighs $11\frac{1}{2}$ commercial oncie. *Liquid Capacity:* 1 corba = 2 mezzacorba = 4 quarterone or quarterole = 60 boccale = 240 foglietta. *Dry Capacity:* 1 corba = 2 stajo or staro = 8 quarterone = 32 quarticino or quartuccione. These two corbe are of the same capacity. *Agrarian:* 1 tornatura = 140 square pertica = 14000 square pié. *Rome.*—*Weight:* 1 libbra = 12 oncia = 288 denaro = 6912 grano. The same weight serves for gold and silver, and for medicine. *Liquid Capacity:* 1 botta = 16 barile = 512 boccale = 2048 foglietta = 8192 quartuccio. The barile for oil contains only $\frac{1}{4}$ of the above, or 28 boccale. But oil has a proper measure, viz.: 1 soma = 2 mastello or pelle = 20 cugnatello = 80 boccale. *Dry Capacity:* 1 rubbio = 2 rubbiatella = 4 quarta = 8 quartarella = 12 staja = 16 starello = 22 scorzo = 88 quartuccio. *Length and Distance:* 1 canna (ordinary) = 2 braccio = 6 pié = 8 palmo = 24 linea; 1 canna (architects', etc.) = $7\frac{1}{2}$ pié = 10 palmo = 120 oncia = 600 minuto = 1200 decimo; 1 canna di ara = $1\frac{1}{2}$ braccio di ara = 9 palmo di ara; 1 catena = 10 stajolo = $57\frac{1}{2}$ palmo (architects'). *Agrarian:* 1 rubbio = 4 quarta = 7 pezza = 16 scorzo = 32 quartuccio = 112 square catena = 11200 square stajolo = 370300 square palmo (architects').

Russia in Europe: St. Petersburg.—*Weight:* 1 funt = 12 lana = 32 loth = 96 zolotnic = 9216 doli. This is used for gold and silver also, and the Nürnberg weight by apothecaries. 1 packen = 3 berkowitz = 30 pud = 1200 funt. *Liquid Capacity:* 1 vedro = 4 tschetwerk = 8 osmushka = 88 tscharkey. Since 1819 the vedro = 100 tscharkey. 1 sarokowaja = $13\frac{1}{2}$ anker = 40 vedro. *Dry Capacity:* 1 tschetwert = 2 osmin = 4 pajak = 8 tschetwerik = 32 tschetwerka = 64 garnetz. *Length and Distance:* 1 archine = 2 stopa = 24 verschok = 32 paletz. This was the old measure. Within the last twenty years, both the English foot and the Rhine foot have come into use; and since 1881 the former has furnished, it is believed, the normal standard of value. At present the archine is divided into 16 verschok. 1 verst = 500 sachine = 1500 archine = 24000 verschok. The sachine is 7 feet exactly. Besides the verst, the meile of Lithuania is also used, equivalent to 28530 rheinfuss. *Warsaw.*—The legal weights and measures of Poland are supposed to be, since 1881, subordinate to those of the Russian empire, of which it forms a part. The establishment in 1819, while

Poland had still its own Legislature, and which rested upon the French metrical system, is nearly as follows: *Weight:* 1 funt = 16 lana = 32 loth = 48 skoyciec = 128 drachme = 384 skrupulow = 9216 granow = 50688 granikow = 405504 milligrammow. The milligrammow is exactly the milligram of France. The apothecary pound is $358\frac{1}{2}$ grams of France, and divided like Nürnberg weight. The old funt of Warsaw proper was $\frac{1}{10}$ lighter; and the old quintal was of 5 kaminieck, or 160 funt. The new kaminieck is of 25 funt. *Liquid Capacity:* 1 stangiew = 2 becza = 50 garniec = 200 kwarti = 800 kwaterki. The kwarti is the litre of France, and the becza, therefore, the hectolitre. Formerly the becza was divided into 36 garniec, and 144 kwarti. *Dry Capacity:* 1 korzec = 4 cwierc = 32 garniec or garcy = 128 kwarti = 612 kwaterki. The kwarti is the same for all capacity; and the korzec is, therefore, 128 litres of France. *Length:* 1 lokiec = 2 stopa = 4 cwierc = 24 calow = 288 liniow = 576 millimetrow = 576 millimetre of France; 1 sznurow = 10 pretow = 100 precikow = 150 stopa = 1000 lawek = 1800 calow. The precikow is the geometrical foot, used by surveyors. Itinerary distances are measured by the verst of Russia, 8 of which (= 29633 stopa) make the unitary league. *Agrarian:* 1 wloka = 30 morgow = 90 square sznurow = 9000 square pretow = 900000 square precikow.

Sardinia.—The weights and measures of the island of Sardinia, which can not be called systematic, will be found in the Dictionary. *Duchy of Genoa.*—*Weight:* 1 libbra (peso scarso) = 12 oncia = 288 denaro = 6912 grano. This is the ordinary weight of commerce, which is used also by apothecaries. The rotolo is $1\frac{1}{2}$ libbra. The peso grosso is 10 per cent. heavier than the peso scarso, and has sometimes its rotolo. Gold and silver are weighed by the marco of Turin. The rubbio, or quarter of the centinajo, has 25 libbra in either weight. *Liquid Capacity:* 1 mezzaruola = 2 barile = 100 pinta = 180 amola. *Dry Capacity:* 1 mina = 8 quarto = 96 gombetta. *Length:* 1 piede liprando = 12 oncia = 144 punto = 1728 atomo; 1 piede manuale = 8 oncia; 1 canna = $4\frac{1}{2}$ braccio = 10 palmo = $6\frac{3}{4}$ piede manuale. But this last is hypothetical. The land surveyors use a canna of 12 palmo, which is properly a canella. But canne are found of all lengths, from 8 to 12 palmi. *Turin.*—*Weight:* 1 libbra = $1\frac{1}{2}$ marco = 12 oncia = 96 ottavo = 288 denaro = 6912 grano = 165888 granottino. For gold and silver the marco is divided as under: 1 marco = 8 oncia = 192 denaro = 1152 carato = 4608 grano = 110592 granottino. The apothecary pound is $1\frac{1}{2}$ marco, and is divided like the same weight at Bologna. *Liquid Capacity:* 1 carro = 10 brenta = 360 pinta = 720 boccale = 1440 quartino. *Dry Capacity:* 1 sacco = 8 stajo = 6 mina = 12 quartiere = 48 copello = 960 cucchiaro. *Length:* The smaller measures are divided as at Genoa. 1 pertica = 2 trabucco = $10\frac{1}{2}$ raso = 12 piede liprando. *Itinerary:* 1 miglio = 1300 tesa = 4333 $\frac{1}{3}$ piede liprando = 6500 piede manuale. *Agrarian:* 1 giornata = 100 tavola, or square pertica = 400 square trabucco = 14400 square piede liprando.

Saxony.—For the weights and measures of this kingdom, where there has been no recent establishment, will be taken what prevails at Leipsic. *Weight:* 1 pfund = 2 mark = 16 unze = 32 loth = 128 quantlein = 516 pennig = 7680 gran. Gold and silver are by the mark of Cologne. Apothecary weight is that of Nürnberg. The centner, or hundred-weight, consists generally of 110 pfund, but for live stock it is only 102 pfund; that called *berg-gewicht* at the mines, is 114 pfund; and *stahl-gewicht*, for iron and steel, is 118 pfund. *Liquid Capacity:* 1 fuder = $2\frac{1}{2}$ fass = 4 tonne = 6 ahm = 12 eimer = 14 anker = 756 kanna = 1512 nüssel = 6048 quartier. The fuder of Dresden is similarly divided, but is smaller, containing only 672 kanne of Leipsic. *Dry Capacity:* 1 wispel = 2 malter = 24 scheffel = 96 viertel = 384 metze = 1536 müsschen. *Length:*

1 elle=2 fuss=24 zoll=240 linie. The fuss is also decimally divided. 1 ruthe=10 elle=16 fuss. *Itinerary*: 1 polizei-meile=2000 ruthe=16000 elle=32000 fuss; 1 post-meile=1500 ruthe=12000 elle=24000 fuss. *Agrarian*: 1 morgen=300 square ruthe=76800 square fuss.

The Two Sicilies.—The weights and measures of the island of Sicily are given in the Dictionary, corresponding to the localities of Messina, Palermo, and Syracuse; they are too unsystematic to be detailed here. What follows belongs properly to the city and district of Naples. *Weight*: 1 libbra=12 oncia=360 trapeso=7200 accino. This weight is for gold and silver, for silk, for spices, for drugs and colors. All other articles are weighed by the rotolo of $2\frac{1}{2}$ libbre, or $3\frac{1}{2}$ oncie. The apothecary unit is the same libbra, but divided as follows: 1 libbra=12 oncia=120 drachma=360 scrupolo=7200 accino. *Liquid Capacity*: 1 carro=2 botta=24 barilo=1440 caraffa; 1 salma, for oil=16 staja=256 quarto=320 pignata=1536 misurella. *Dry Capacity*: 1 carro=86 tomolo=864 misura. *Length and Distance*: 1 canna=8 palmo=96 oncia=480 minuto; 1 pertica or passo=7 $\frac{1}{2}$ palmo; 1 miglio=933 $\frac{1}{3}$ passo=7000 palmo. *Agrarian*: 1 morgia=900 square passo=50625 square palmo.

Spain.—The weights and measures given for this kingdom apply especially to Castille, and are recognized at Madrid. Considerable differences in value, and some also in nomenclature, will be found existing in several of the great provinces of Spain; as, for example, in Valencia, where long comparative independence naturally led to a result of this kind, which is further contributed to elsewhere by the remarkable number of distinct races by which Spain is peopled. But these variations are not sufficiently material to be detailed here.

Weight: 1 libra=2 marco=16 onza=128 ochava=256 adarme=768 tomine=9216 grano. Gold and silver are by the same weight; but the marco is the unit, and is divided for gold only, as follows: 1 marco=50 castellano=400 tomine=4800 grano. This division has been, to be sure, interdicted by law; but it still remains, and is especially exemplified in the former South American dependencies of Spain. In apothecary weight: 1 libra=1 $\frac{1}{2}$ marco=12 onza=96 drachma=288 escrúpulo=576 obolo=1728 carater, or quilate=6912 grano; 1 tonelada=20 quintal=80 arroba=2000 libra; 1 quintal macho=6 arroba=150 libra. *Liquid Capacity*: 1 arroba mayor, or cantara=4 quartilla=8 azumbre=32 quartillo=128 copa. This arroba, in theory, should contain 35 libras of distilled water, at the ordinary pressure and temperature. The arroba menor for oil is divided in the same manner, but weighs only $27\frac{1}{2}$ libras, as before. *Dry Capacity*: 1 cahiz=12 fanega=144 almude, or celemine=288 medio=576 quartillo=2304 racion=9216 ochavillo. *Length*: 1 vara=3 pie or tercia=4 palmo or quarta=6 sesma=36 pulgada=48 dedo=432 linea=5184 punto. *Distance*: 1 estadal=2 estado, toesa, or braza=2 $\frac{1}{2}$ paso=4 vara=8 codo=12 pie. There is also a former estadal (before 1801), which still serves as a basis for an agrarian measure, and=11 pie. 1 cuerda=8 $\frac{1}{2}$ vara=24 $\frac{1}{2}$ pie=33 palmo mayor. But in Valencia: 1 cuerda=20 braza=40 vara; 1 legua (till 1568)=3 milla=24 estadio=3000 paso=5000 vara=15000 pie; 1 legua (of Philip V.)=7605 vara=22815 pie. This was a league of which 17 $\frac{1}{2}$ were supposed to make a degree, and was directed to be used on all maps. 1 legua (since 1766)=4800 paso=8000 vara=24000 pie. It is by this that the distances along the great roads are marked. But there is also a legua frequently used, estimated at 800 cuerda=6600 vara=19800 pie. *Agrarian*: 1 yugada=50 fanegada=600 celemin=2400 quartillo=28800 square estadal=460800 square vara. But in Valencia: 1 yugada=6 cahizada=36 fanegada=7200 square braza, and is but the $\frac{1}{13}$ nearly of the legal yugada. 1 arançada (for vineyards and crops of

oats)=400 square estadal=48400 square pie: the estadal being here but 11 pie.

Sweden.—*Weight*: 1 skålpund (viktualievägt)=16 untz=32 lod=128 qwintin=8848 as. There are several commercial pounds in this kingdom, applicable under different circumstances and to different articles; but none are commensurable with the skålpund, except that called *jernvägt*, or the iron pound, which is $\frac{4}{5}$ of the other. They are all to be found in the Dictionary under the word skeppund, by which multiple, indeed, they are usually counted. Gold and silver is weighed by the mark of Stockholm, which is incommensurable with the skålpund, but very nearly half of it. It is divided as follows: 1 mark=8 untz=16 lod=64 qwintin=4384 as. The apothecary pound, or libra=7416 as, and is subdivided like the Nürnberg pound: 1 skeppund=20 lispund=400 pund. *Liquid Capacity*: 1 tunna=48 kanna=96 stop=384 qwarter=1536 ort, or jungfru. *Dry Capacity*: 1 tunna=2 spann=4 half-spann=8 fjerding=32 kappe=56 kanna=112 stop=448 qwarter=1792 ort. *Length*: 1 famn=3 aln=6 fot=72 tum=864 linie. But in late times the foot is divided decimally for all purposes. 1 stång=8 aln=16 fot; 1 mil=2250 stång=6000 famn=18000 aln=36000 fot. *Agrarian*: 1 tunna=2 spannland=4 half-spannland=8 fjerding=32 kappland=56 kannland=218 $\frac{1}{2}$ square stång=14000 square aln=56000 square fot. *Solid*: 1 vedfamn=6 F. long \times 6 F. high \times 3 F. deep=108 cubic fot.

Switzerland.—Nearly every one of the twenty-two cantons of which this confederation is composed appears to present some variety in the values, subdivisions, and nomenclature of its weights and measure. To explain them summarily is impossible; to expose them in detail would occupy a space manifestly disproportionate to their practical interest. What prevails at Bern, Lucerne, and Zurich (the three legislative capitals, biennially in rotation, of the Swiss confederacy), is all that need be given here. *Bern*.—*Weight*: 1 pfund=16 unze=32 loth=128 quent=512 pfennig. This is the ordinary commercial weight; that for gold and silver, etc., is divided into 2 marks, and then like the preceding. The mark in this weight is the old marc of France; the ordinary pfund=17 ounces poids de marc of France. The apothecary weight is, in fact, about $\frac{1}{4}$ of 1 per cent. lighter than the Nürnberg; it is, no doubt, in theory the same, and is divided similarly. *Liquid Capacity*: 1 landfass=6 saum=24 eimer or brenter=600 mass=2400 vierteli=4800 becher. *Dry Capacity*: 1 mütt=12 mäss=24 mässli=48 immi=96 achterli=192 sechszehnerli. *Length*: 1 fuss=12 zoll=144 linie=1728 secunde. The *steinbrecher fuss*, used for quarrying and building stone=13 zoll. The elle happens to be exactly $1\frac{88}{100}$ of the fuss; but this is an accidental coincidence, as they are not used commensurably. *Itinerary*: 1 ruthe=1 $\frac{1}{2}$ klafter=3 $\frac{1}{2}$ wald-schritt=4 feld-schritt=10 fuss. The ordinary Swiss meile is no longer commensurable with any Swiss foot. It seems to have been originally 2666 $\frac{2}{3}$ fuss, for its length would not differ materially from that multiple of the fuss. *Agrarian*: 1 juchart, or feld acker=400 square ruthe=40000 square fuss. For woodland, the juchart is 450; for gardens, 360; for meadow land, 350 and 320; and, finally, for suburban mensuration, 312 $\frac{1}{2}$ square ruthe. *Solid*: 1 klafter=6 F. long \times 5 F. high \times 8 $\frac{1}{2}$ F. deep=108 solid fuss. *Lucerne*.—*Weight*: 1 pfund=36 loth=144 quentchen. This is the division of Lucerne proper; but the weights of Zurich are also in use. Gold and silver are weighed by the mark of Zurich; but the apothecary pound is the old medicinal weight of France. *Liquid Capacity*: 1 saum=3 $\frac{1}{2}$ ohm=100 mass=400 schoppen=4000 prima. *Dry Capacity*: 1 malter=4 mütt=16 viertel=32 halb-viertel=160 immi=256 becher=2560 prima. *Length*: 1 elle=2 schuh, or rheinfuss. The carpenters' foot (tischler-schuh) is nearly 3 per cent. shorter; and the builders' and surveyors' foot (feld-schuh) 10

per cent. shorter than the rheinfuss. Other measures are those of Zurich. *Zurich*.—*Weight*: 1 pfund=18 unze=36 loth=144 quenten; 1 pfund (of Antorf, for gold and silver, etc.)=2 mark=16 unze=82 loth=128 quent=512 pfennig. This weight is $\frac{3}{8}$ of the commercial weight. The apothecary pound is that of Lucerne. *Liquid Capacity*: 1 eimer (lauter-mass)=4 viertel=30 kof=60 mass=120 quärtli=240 stotzen. The eimer (stadt-mass) for wine in retail is subdivided in the same manner, but is 10 per cent. smaller. 1 eimer (trübes mass)=4 viertel=32 kof=64 mass=128 quärtli=256 stotzen. This eimer (which, as its name implies, is for wine unrefined, as the lauter-mass is for fined wine) is $\frac{1}{16}$ larger than the latter. *Dry Capacity*: 1 malter=4 mütt=16 viertel=64 vierling=256 müssli=576 immi. The malter for grain generally, and all dry seeds and fruits (*glatte frucht*), contains 12 $\frac{1}{2}$ cubic feet; that for oats and for green articles (leguminous growth, *rauhe frucht*) contains 12 $\frac{1}{2}$ cubic feet. *Length*: 1 fuss=12 zoll=144 linie=133 lignes de Paris. The same fuss is divided decimally by surveyors. The architectural foot, since 1820, is $\frac{6}{1330}$ longer, but divided like the ordinary fuss. 1 ruthe=2 elle=10 fuss. *Agrarian*: The ordinary juchart=400 square ruthe=4000 square fuss. There are also juchart in the same variety (except the very smallest), and similarly applicable as at Bern. *Sold*: 1 klaf-ter, for fire-wood=6 F. long×6 F. high×4 F. deep=144 cubic fuss. There are also klaf-ter of 72 and 108 cubic fuss, the billets being 2 and 3 feet long respectively. The klaf-ter for turf (torb-klaf-ter) contains 12 korb of 6 cubic fuss, each=72 cubic fuss. In 1828 a new system of weights and measures was proposed and adopted for the Cantons of Aarau, Basle, Bern, Frei-burg, Lucerne, Solothurn, and Vaud, which rested upon the metrical system of France; but, except in the Canton of Vaud, it has not been generally carried out.

Tuscany.—*Weight*: 1 libbra=12 oncia=96 drachma=288 denaro=6912 grano. The same weight answers for gold and silver, and for apothecary use. The legal centinajo or cantaro (as in all the cases hitherto not specially mentioned) is 100 libbre; but the cantaro for wool, meat, and salt fish is yet 160 libbre. *Liquid Capacity*: 1 barile=20 fiasco=40 boccale=80 mezzetta=160 quartuccio, weighing 133 $\frac{1}{2}$ libbra; 1 barile for oil, or olio=16 fiasco=32 boccale=64 mezzetta=128 quartuccio, weighing 120 libbre. The soma for oil is 2 barile. The barile of alcohol, brandy, and rum weighs 120 libbre. *Dry Capacity*: 1 moggio=8 sacco=24 stajo=48 mina=96 quarto=384 metadella=768 mezzetta=1536 quartuccio=3072 bussolo. *Length*: 1 canna=4 braccio=8 palmo=80 soldo=960 denaro; 1 canna (architects' and surveyors') or pertica=2 $\frac{1}{2}$ passetto=5 braccio=10 palmo=60 crazia=100 soldo=300 quattrino=1200 denaro. *Itinerary*: 1 cavizzo=2 passo=6 braccio; 1 miglio=566 $\frac{2}{3}$ canna (architects')=2833 $\frac{1}{3}$ braccio=5666 $\frac{2}{3}$ palmo. *Agrarian*: 1 saccato=10 stajolo=13 $\frac{1}{2}$ storo=165 panoro=660 square pertica=16500 square braccio.

Württemberg.—*Weight*: Divided as the Prussian, from which it differs but slightly in value. Gold and silver are weighed by the mark of Cologne, and medicine by the apothecary weight of Nürnberg. *Liquid Capacity*: 1 fuder=6 eimer=96 immi=960 mass=3840 schoppen. The eimer is of a different capacity, according as it is for clear or unrefined wine. The latter is nearly 4 $\frac{1}{2}$ per cent. larger than the former. *Dry Capacity*: 1 scheffel=8 simri=32 vierling or viertel=64 achtel=128 mässlein=256 ecklein=1024 viertelein. *Length*: 1 fuss=10 zoll=100 linie=1000 punkt. This measure was established in 1806, when the fuss was fixed at 127 lignes de Paris. The elle is not aliquot with the fuss, being 21 $\frac{1}{4}$ lignes de Paris. 1 ruthe=1 $\frac{1}{2}$ klaf-ter=10 fuss. This is the modern division. In the older habits there was 1 $^{\circ}$, a ruthe of 16 fuss; 2 $^{\circ}$, one of 12 rheinfuss; and 3 $^{\circ}$, one of 15

rheinfuss. These different lengths affected, of course, the value of the acre. *Agrarian*: 1 morgen=4 vier-telmorgen=384 square ruthe=38400 square fuss. This is the legal measure, which corresponds in value with the old count of 150 square ruthe (of 16 fuss in length) to the morgen. There is also the little morgen (old measure) of 150 square ruthe (No. 3)=38750 square rheinfuss; and the great morgen (old measure) containing 400 square ruthe (No. 2)=57600 square rheinfuss. 1 juchart or jauchert=1 $\frac{1}{2}$ morgen.

The variations in the computation of the mile, the gallon, the bhd., and the barrel, are so great in various countries, that we give a list by way of comparison.

MILE.		
Miglio, since 1803...	Austr. Lombardy.	0.6214 miles.

For the greater part of the preceding article we are indebted to the able work of J. H. Alexander, Esq., entitled *Universal Dictionary of Weights and Measures, Ancient and Modern, reduced to the standards of the U. S.*, to which we refer for more extended information.

Ancient Weights and Measures.—This subject is involved in considerable difficulty, and to enter fully into it would be quite inconsistent with our objects and limits. But the following details, abstracted from the best authorities, may be useful to such of our readers as have occasion to look into the ancient authors.

TABLE OF VARIOUS ANCIENT WEIGHTS (according to different Authorities).

Attic obolus	English Troy Grains.	82	Christiani.
		91	Arbuthnot.
Attic drachma		51.0	Christiani.
		54.6	Arbuthnot.

ALEXANDER); *North American Rev.*, xlv. (PERCIVAL), xiv. (FARRAR); *Westminster Rev.*, xvi.; *Edinb. Rev.*, lxxvii. 121; *HUNT'S Merchants' Magazine*, xii. 549, iv. 333, 434 (D. J. BROWNE); *NILES'S Register*, xiv., xv., xx., xxii., xxx., xl.; *Report of Mr. J. Q. ADAMS*, 8vo.

Weld, or **Dyer's Weed** (Ger. *Wau*; Du. *Wouw*, *Wouwe*; Fr. *Gaude*; It. *Guadarella*; Lat. *Luteola*), is an imperfect biennial, with small fusiform roots, and a leafy stem from one to three feet in height. It is a native of Great Britain, Italy, and various parts of Europe; and is cultivated for the sake of its stalk, flowers, and leaves, which are employed in the dyeing of yellow, whence its botanical name *Reseda luteola*. Weld requires the growth of nearly two summers before it comes to maturity; and the crop is liable to fail from so many causes, and is besides so exhausting, that its cultivation is by no means profitable. Weld is preferred to all other substances in giving the lively green lemon yellow. It is, however, expensive; and it is found, when employed in topical dyeing, to de-grade and interfere with madder colors more than other yellows, and to stain the parts wanted to be kept white. Hence quercitron bark is now employed in calico-printing, to the almost total exclusion of weld. It is still, however, employed in dyeing silk a golden yellow, and in paper-staining.—*LOUDON'S Encyclopaedia*.

West Indies (*Antilla* or *Antilles*), an Archipelago of islands which extend from the Gulf of Florida to the Gulf of Paria, and form part of the division Central America, between lat. 10° and 23° N., and long. 59° and 85° W.; bounded on the north and east by the Atlantic, and on the south by the Caribbean Sea, which separates them from the north coast of South America. The northwest group contains the largest islands, or Greater Antilles, as Cuba, San Domingo, Jamaica, and Porto Rico. The other group, or Lesser Antilles, stretching from north to south, consists of Guadeloupe, Martinique, Barbadoes, Trinidad, etc. The Bahamas form a third group. The Lesser Antilles, from Porto Rico to the Gulf of Paria, are by some writers called the Windward Islands, and the smaller group along the coast of Venezuela, the Leeward Islands; but in British charts the *Windward Islands* comprise those between lat. 10° and 15° N., and the *Leeward* those between lat. 15° and 19° N.

LEEWARD ISLANDS.

Virgin Isles.....	Redonda.
Anguilla.....	Montserrat.
St. Martin.....	Antigua.
St. Bartholomew.....	Barbuda.
Saba.....	Guadeloupe.
St. Eustatius.....	The Saintes.
St. Christopher.....	Desada.
Nevis.....	Marie-Galante.
Dominica.....	

WINDWARD ISLANDS.

Martinique.....	Curaçoa.
St. Lucia.....	Buen Ayre.
Barbadoes.....	Los Roques.
St. Vincent.....	Orchilla.
Bequia.....	Blanca.
The Grenadines.....	Tortuga.
Grenada.....	Salada.
Tobago.....	Margarita.
Trinidad.....	Cubagua.
Cuba.....	Coele.

The total area of the Archipelago is 95,100 square miles. Population, 3,684,000. The Lesser Antilles are of volcanic origin. Climate of the whole tropical, but modified by the surrounding ocean and the elevated land of many of the islands. Sugar, coffee, cotton, dye-woods, and spices, are the chief products and exports. Of these islands, France possesses Guadeloupe, Martinique, Desada, Marie-Galante, and part of St. Martin; to Spain belong Cuba and Porto Rico; to Denmark, Santa Cruz, St. Thomas, and St. John; to Holland, St. Eustatius, Saba, Curaçoa, and part of St. Martin; to Sweden, St. Bartholomew; Hayti is governed by rulers chosen from the citizens of each of its two governments; Margarita and adjacent isles belong to the republic of Venezuela; and Anguilla, Antigua, Barbadoes, Dominica, Grenada, Jamaica, Montserrat, Nevis, St. Christopher, St. Lucia, St. Vincent, Tobago, Tortola, Trinidad, Bahamas, and Bermudas, belong to Great Britain. Columbus landed on St. Salvador, Bahama group, in October, 1492; and the Archipelago, under the erroneous impression, at the time of discovery, that it formed part of Asia, was called the *West Indies*.

Particular descriptions are given under the heads of the various islands, and we shall therefore limit this article to the statistics of the trade between the United States and the several West Indies.

AREAS OF THE WEST INDIES.

Islands.	Area in Sq. Miles.
San Domingo.....	29,000
Spanish { Cuba.....	42,383
{ Porto Rico.....	3,865
{ Trinidad.....	2,020

{ Bahamas.....	3,982
{ Turks Island and Caicos.....	494
French { Guadeloupe.....	681
{ Martinique.....	382
Dutch West Indies.....	600
Danish West Indies.....	192
Swedish West Indies.....	25
Total square miles.....	91,496

British West Indies.—There are several small islands in the West India group, but they are, in a commercial point of view, too unimportant to require a separate or more special notice, being all comprised under some of the consular districts for which full returns of trade, port regulations, etc., are given in the preceding pages. American trade with the West Indies is placed on an equal footing with that of the most favored nations. Indeed, in some of the islands, as in Canada, American vessels are allowed privileges that are not sanctioned, if not expressly withheld, by the colonial regulations of the mother country. In both these divisions of the British North American possessions they are admitted, to a certain extent, to the benefits of the coasting trade; thus proving how impossible it is for the mother country to frame commercial regulations adapted, in all respects, to the wants and necessities of her colonies in distant quarters of the globe, the effect, if not the design, of which would be to embarrass and clog their intercourse with the neighboring markets.

The act of the Imperial Parliament, 13 Victoria, chap. xxix., secs. 4, 5, 6, clothes the governor-general of the East India possessions with ample powers to admit to the coasting trade, in that part of the globe, all foreign vessels, whenever, in his opinion, the requirements of commerce or the interests of her majesty's subjects in the East Indies may demand such a concession. By virtue of this authority, the coasting trade of these vast possessions is now thrown open to every flag. A similar act in favor of the West India and North American possessions would seem to be more imperatively demanded, even as a boon to British subjects in these parts, particularly in the West Indies, where but few of the staple articles of food are produced, and such as are imported are necessarily burdened with the taxes and imposts incident to reshipment coastwise, and transportation into the interior, before they reach the consumer. Such a measure would be productive of the happiest results; and, while it would impart additional stimulus to American enterprise, it would, at the same time, cheapen all the necessaries of life to the North American subjects of Great Britain, who, by reason of their geographical proximity and their different staples of trade, are the natural customers of the United States.

Official returns received at the Department of State represent American commercial intercourse with the British West Indies generally as being on the most satisfactory footing. Indeed, nothing seems wanting to render that intercourse wholly unembarrassed, save a modification, if not a total repeal, of the protective tariff now in force in Great Britain, in favor of some of the staple productions of these islands.

Danish West Indies.—The colonial possessions of Denmark are the Færoe Islands, Iceland, Greenland, and the islands of Santa Cruz, St. Thomas, and St. John, in the West Indies. Tranquebar and Serampore, in the East Indies, were sold to the English East India Company in 1846. The extent and population of these, in 1850, were as follows:

	Sq. Miles.	Population.
Færoe Islands.....	495	8,150
Iceland.....	38,200	60,000
Greenland.....	3,950	9,400
West Indies:		
Santa Cruz.....	74	23,720
St. Thomas.....	23	18,666
St. John.....	21	2,223
Total.....	42,763	117,164

Dutch West Indies.—The principal island is Curaçoa, or Curaçoa, in the Caribbean Sea, belonging to the Dutch, off the north coast of Venezuela. Lat. 12° N., long. 69° W. Length, forty miles; breadth, six to ten miles. Population (1849) of Curaçoa and St. Eustache, 26,811. Shores bold; surface hilly; soil not rich, and deficient in water, yet a good deal of sugar, indigo, tobacco, and maize are raised. Principal port is Santa Anna, on the southwest side of the island, the entrance to which is narrow, but the harbor secure.

COMMERCE OF THE UNITED STATES WITH THE BRITISH WEST INDIES, FROM OCTOBER 1, 1920, TO JULY 1, 1937.

* Nine months to June 30, and the fiscal year from this time begins July 1.

French West Indies.—The following table gives the general trade of France with its colonies, in 1853:

Colonies.	Imports.	Exports.
Martinique	465,441	4765,577
Guadaloupe	423,655	570,434
Bourbon	851,647	684,946
Senegal	287,296	392,369
Cayenne	56,833	181,044
India	609,723	21,384
Algiers	1,132,304	3,355,966
St. Pierre and Miquelon, etc.	617,681	273,687
Isles Mayotte and Madagascar	8,627	36,584

The trade to Bourbon Island, Guyana, Martinique, and Guadaloupe, out and home, employed in 1848, 492 ships; in 1849, 541; in 1850, 486; in 1851, 602; in 1852, 677; in 1853, 583. The mean of the six years, 565 vessels.

Swedish West Indies.—The island of St. Bartholomew is the only possession of the Swedes in America. It belongs to the Leeward group, and is situate centrally in lat. 17° 50' N., and long. 62° 52' W., distant twelve miles from St. Martin, and about thirty from St. Christopher. It is about eight miles long by from two to three miles wide, and contains an area of about twenty-five square miles. Capital, Gustavia. The island is of an irregular shape, and deeply indented by numerous small sandy bays, separated by bold and steep rocky acclivities, of moderate height. In the interior it is hilly, but its loftiest elevations are less than 1000 feet. In most parts it is barren and sterile, but has numerous well-cultivated valleys. It produces all the staples of the West Indies—cotton, sugar, tobacco, indigo, etc., and also lignum vite and iron-wood. Its only exports are cattle and some salt. Water is scarce, and the inhabitants depend for supply on the rains. The only harbor is La Carenage, a safe and commodious one, and much frequented. It is on the west side of the island. Close by is Gustavia, the principal town, a thriving place.—For articles on British Emancipation, British Colonies, etc., see *Eclectic Review* (4th series), iv., ix.; *Christian Quarterly Spectator*, x.; *FRASER'S Magazine*, viii.; *Edinburgh Rev.*, xix., xli., xlv., xl.; *Quarterly Rev.*, xxxii., xxxviii. (SOUTHEY), xlv.; *Westminster Review*, i.; *BLACKWOOD'S Mag.*, xiv., xv., xvi., xxxi., xxxiv., lxiii.

Whalebone, a substance of the nature of horn, adhering in thin parallel laminæ to the upper jaw of the whale. These vary in size from three to twelve feet in length; the breadth of the largest at the thick end, where they are attached to the jaw, is about a foot. They are extremely elastic. All above six feet in length is called *size bone*. This article was first known in England about the year 1693. It may be worth while to remark, as evincing the ignorance that at one time prevailed with respect to the whale, that, by an old English feudal law, the *tail* of all whales belonged to the queen, as a perquisite, to furnish her majesty's wardrobe with whalebone!—BLACKSTONE, vol. i. p. 233. The import of whalebone into the United States for a number of years past has been as follows:

	Pounds.		Pounds.
1847	3,311,080	1852	1,259,900
1848	2,003,000	1853	5,652,300
1849	2,281,101	1854	3,445,200
1850	2,809,200	1855	2,797,500
1851	3,616,500	1856	2,387,400

—See **WHALE-FISHERIES**. Whalebone first became in use in Europe in the 17th century.—See p. 390.

Whale-fishery.—*Whale* (Common), the *Balæna mysticetus* of Linnæus, a marine animal of the cetaceous species, and the largest of all those with which men are acquainted. The whale has, it is affirmed, been found one hundred and sixty feet in length; but this is most probably an exaggeration. In the Northern seas it is at present seldom found above sixty feet long: being, however, generally killed before it arrives at its full growth, this is no proof that the animal may not formerly have attained to a much larger size. The bodies of whales are covered, immediately under the

skin, with a layer of fat or *blubber*, which in a large fish is from twelve to eighteen inches thick. In young whales this fatty matter resembles hog's lard, but in old ones it is of a reddish color. This is the valuable part of the whale, and the desire to possess it has prompted man to attempt the capture of this mighty animal. The blubber yields, by expression, nearly its own weight of a thick, viscid oil (train oil). The common whale is now rarely found, except within the Arctic circle; but at a former period it was not unfrequently met with on our coasts. There is a good account of the common whale, and of the manner in which the fishery is carried on, in Mr. JOHN LAING'S *Voyage to Spitzbergen*, one of the shortest, cheapest, and best of the innumerable books published on this hackneyed subject.

1. *The Sperm Whale* (the *Cachalot* or *Physeter macrocephalus*).—The principal species are the black-headed with a dorsal fin, and the round-headed without a fin on the back, and with fistula in the snout. This whale is known at a distance by the peculiarity of his "spoutings" or "blows." He can be easily detected by whalers, if he happens to be in company with other species of whales. He blows the water or vapor from his nostrils in a single column, to the height, perhaps, of twelve feet, inclining in a forward direction, in an angle of forty-five degrees with the horizon, and visible for several miles. There is also a wonderful regularity as to time in which he "blows," perhaps once in ten minutes. He remains on the surface of the water from forty-five to sixty minutes, and under water about the same time. Unless the whale is frightened, whalers make quite correct calculation as to the chances of overtaking him, or meeting him, or when he will rise to the surface after he has "turned flukes." When the sperm whale is near he can be easily distinguished by the form of his head, unlike any other variety of whale. Its head is enormous in bulk, being fully more than one-third of the whole length of its body, and it ends like an abrupt and steep promontory, and so hard for several feet from its front, that it is quite difficult, if not impossible, for an iron to enter it; as impervious, indeed, to a harpoon as a bale of cotton. Besides, the sperm whale has a hump on his back, which distinguishes him from others. This hump is farther forward than the hump on the finback whale. Sperm whales have been captured from seventy to ninety feet in length, and from thirty to forty-five feet in circumference round the largest part of their bodies. It is supposed by whalers, from their appearance, that they live, or some of them at least, to a great age. One writer on this subject thought that the sperm whale would attain the age of many hundred years, and even to a thousand years. This, however, is mere conjecture, because there are no dates or facts upon which to found a correct opinion.

It is supposed, that as the sperm whale advances in age, his head not only retains its ordinary proportions, and to appearance becomes enlarged, but the truth is, the other parts of his body, especially his extremities, do actually diminish in bulk and circumference. In some instances more oil has been taken out of the head of a sperm whale than from the other part of his body. The principal food of the sperm whale is "squid," a molluscous animal. "This is an animal of so curious an order as to merit a word of special notice. The principal peculiarity of this molluscous tribe is the possession of powerful tentacula or arms, ranged round the mouth, and provided with suckers, which give them the power of adhering to rocks, or any other substances, with surprising tenacity. Some of this tribe attain to a great size, and, as large as the whale is, will furnish it with no contemptible mouthful. In the gullet of one sperm whale an arm or tentaculum of a sea-squid was found measuring nearly twenty-seven feet long." Whalers frequently discover large masses or junks of squid floating about, probably torn in pieces

by whales in their search after food. The flesh of the squid is soft, without bones, and somewhat transparent, like the common sun-fish seen on our shores. It is said that squid have been seen as large as an ordinary whale. This food for the sperm whale is found in great abundance in the Pacific seas.

2. *The Right Whale*.—The whale having this general cognomen belongs to the species of *Balæna mysticetus*. There are several varieties included in this species, as we shall hereafter observe, and which are distinguished by whalers both in regard to some external peculiarity as well as the different localities where they are usually found. The right whale differs from the sperm in the following particulars: His head is sharper, more pointed—he has no “hump” on his back—the column of water which he throws up when he “blows” is divided like the tines of a fork, and it rises from his breathing-holes in a perpendicular direction, from eight to twenty feet. The right whale furnishes the bone (*balæen*) so much in common use, and called “whalebone.” This bone is taken from the mouth and upper jaw of the whale, and is set along laterally in the most exact order several inches apart, decreasing in length from the centre of his mouth, or the arch of his palate, and becoming shorter farther back; while toward the lips the bone tapers away into mere bristles, forming a loose hanging fringe or border. At the bottom of this row of bone, where it penetrates the gum, and from eighteen to thirty inches downward, we find a material that resembles coarse hair, entwining and interlacing the bone, and thus forming a sort of network, and so thick, that when the whale closes his lips to press out the water the smallest kind of fish are caught in the meshes, and are unable to escape. Indeed, the edges of the bones or slabs, as they might be termed, are fringed with this coarse hair, and it extends to their extremities, as may be seen in the rough state when landed from whale ships. The length of the bones or slabs (average eight feet, longest fourteen feet) vary, in a great measure, according to the size of the fish, though some varieties of this species have larger and better bone than others. The value of the bone is enhanced, as a general thing, in proportion to its length. The principal food of the right whale is a very small red fish, called “brit.” Immense shoals of these fish are seen on whale grounds, and the water to a great distance, even for miles, becomes colored with them.

The right whale does not fight or contend with his mouth or head, as the sperm whale does, but his means of attack and defense are chiefly in his enormous flukes. He will, however, when struck, “root around,” as whalers say, and not unfrequently in this manner upset a boat. This kind of whale, and other varieties distinguished by the *balæen* or bone, have no regular time for remaining on the surface of the water after they “breach,” nor in remaining under water after they “turn flukes.” The length of a large right whale is about eighty feet, and some have yielded their captors 250 to 300 barrels of oil. Such a whale would perhaps weigh not far from eighty tons. The oil of this species of whale is less valuable than the sperm. The whalebone, which now has an advanced price in the market far beyond any previous value attached to it, is obtained from the mouth of the whale about in proportion of 1000 pounds to 100 barrels of oil.

3. *The Finback Whale*.—This is a smooth, slim fish—smaller usually than a right whale. He is found in nearly all latitudes. He has a “hump” on his back, which distinguishes him from the right whale. His head and mouth are of the same construction. This whale is known by whalers, when seen at a suitable distance, by his “blows.” The column of vapor rises in a single stream, in a vertical or perpendicular direction. This fish is termed *Finback*, on account of a fin on his back, differing in this particular from all other species of whale. The oil obtained from him is of the same quality as the right-whale oil.

4. *Bowhead Whale*.—This whale is smooth all over, having no “bonnet on his head,” as whalers say, and as right whales have. Their heads differ in shape somewhat from other whales, and hence the name *Bowhead* given to them. This species of whale, so far as known, have never been found except in the Ochotsk Sea and Arctic Ocean. The Greenland whale, and also the species called the great *Rorqual*, are doubtless included in the name which our whalers give to the *Bowhead*. There are several other varieties of the whale tribe, and different names are attached to them, such as the “Scragg,” the “Humpback,” etc.; but the foregoing are all the kinds whether of interest or profit to whalers.—*Rev. LEWIS HOLMES.*

It is probably true, as has been sometimes contended, that the Norwegians occasionally captured the whale before any other European nation engaged in so difficult and perilous an enterprise. But the early efforts of the Norwegians were not conducted on any systematic plan, and should be regarded only in the same point of view as the fishing expeditions of the Esquimaux. The Biscayans were certainly the first people who prosecuted the whale-fishery as a regular commercial pursuit. They carried it on with vigor and success in the 12th, 13th, and 14th centuries. In 1388, Edward III. relinquished to Peter de Puyanne a duty of £6 sterling a whale, laid on those brought into the port of Biarritz, to indemnify him for the extraordinary expenses he had incurred in fitting out a fleet for the service of his majesty. This fact proves beyond dispute that the fishery carried on from Biarritz at the period referred to must have been very considerable indeed; and it was also prosecuted to a greater or less extent from Cibourne, Vieux Boucan, and subsequently from Rochelle and other places.—See *Mémoire sur l'Antiquité de la Pêche de la Baleine*, by NOËL, 12mo. Paris, 1795. The whales captured by the Biscayans were not so large as those that are taken in the Polar seas, and are supposed to have been attracted southward in pursuit of herrings. They were not very productive of oil, but their flesh was used as an article of food, and the whalebone was applied to a variety of useful purposes, and brought a very high price. This branch of industry ceased long since, and from the same cause that has occasioned the cessation of the whale-fishery in many other places—the want of fish. Whether it were that the whales, from a sense of the dangers to which they exposed themselves in coming southward, no longer left the Icy Sea, or that the breed had been nearly destroyed, certain it is, that they gradually became less numerous in the Bay of Biscay, and at length ceased almost entirely to frequent that sea; and the fishers being obliged to pursue their prey upon the banks of Newfoundland and the coasts of Iceland, the French fishery rapidly fell off.

The voyages of the Dutch and English to the Northern Ocean, in order, if possible, to discover a passage through it to India, though they failed of their main object, laid open the haunts of the whale. The companions of Barentz, who discovered Spitzbergen in 1596, and of Hudson, who soon after explored the same seas, represented to their countrymen the amazing number of whales with which they were crowded. Vessels were in consequence fitted out for the Northern whale-fishery by the English and Dutch, the harpooners and a part of the crew being Biscayans. They did not, however, confine their efforts to a fair competition with each other as fishers. The Muscovy Company obtained a royal charter, prohibiting the ships of all other nations from fishing in the seas round Spitzbergen, on pretext of its having been first discovered by Sir Hugh Willoughby. There can, however, be no doubt that Barentz, and not Sir Hugh, was its original discoverer; though, supposing that the fact had been otherwise, the attempt to exclude other nations from the surrounding seas, on such a ground, was not one that could be tolerated. The Dutch, who were at the time prompt to

embark in every commercial pursuit that gave any hopes of success, eagerly entered on this new career, and sent out ships fitted equally for the purposes of fishing and of defense against the attacks of others. The Muscovy Company having attempted to vindicate its pretensions by force, several encounters took place between their ships and those of the Dutch. The conviction at length became general that there was room enough for all parties in the Northern seas; and in order to avoid the chance of coming into collision with each other, they parceled Spitzbergen and the adjacent ocean into districts, which were respectively assigned to the English, Dutch, Hamburgers, French, Danes, etc.

The Dutch, being thus left to prosecute the fishery without having their attention diverted by hostile attacks, speedily acquired a decided superiority over all their competitors. When the Europeans first began to prosecute the fishery on the coast of Spitzbergen, whales were every where found in vast numbers. Ignorant of the strength and stratagems of the formidable foe by whom they were now assailed, instead of betraying any symptoms of fear, they surrounded the ships and crowded all the bays. Their capture was in consequence a comparatively easy task, and many were killed which it was afterward necessary to abandon, from the ships being already full. While fish were thus easily obtained, it was the practice to boil the blubber on shore in the North, and to fetch home only the oil and whalebone. And perhaps nothing can give a more vivid idea of the extent and importance of the Dutch fishery in the middle of the 17th century, than the fact that they constructed a considerable village, the houses of which were all previously prepared in Holland, on the Isle of Amsterdam, on the northern shore of Spitzbergen, to which they gave the appropriate name of *Smeerenberg* (from *smeeren*, to melt, and *berg*, a mountain). This was the grand rendezvous of the Dutch whale ships, and was amply provided with boilers, tanks, and every sort of apparatus required for preparing the oil and the bone. But this was not all. The whale fleets were attended with a number of provision ships, the cargoes of which were landed at *Smeerenberg*; which abounded during the busy season with well-furnished shops, good inns, etc.; so that many of the conveniences and enjoyments of Amsterdam were found within about eleven degrees of the Pole! It is particularly mentioned that the sailors and others were every morning supplied with what a Dutchman regards as a very great luxury—*hot rolls* for breakfast. Batavia and *Smeerenberg* were founded nearly at the same period, and it was for a considerable time doubted whether the latter was not the more important establishment.—*DE RESTE, Histoire des Pêches.*

During the flourishing period of the Dutch fishery, the quantity of oil made in the North was so great that it could not be carried home by the whale ships; and every year vessels were sent out in ballast to assist in importing the produce of the fishery. But the same cause that had destroyed the fishery of the Biscayans, ruined that which was carried on in the immediate neighborhood of Spitzbergen. Whales became gradually less common, and more and more timid and difficult to catch. They retreated first to the open seas, and then to the great banks of ice on the eastern coast of Greenland. When the site of the fishery had been thus removed to a very great distance from Spitzbergen, it was found most economical to send the blubber direct to Holland. *Smeerenberg* was in consequence totally deserted, and its position is now with difficulty discoverable.

But though very extensive, the Dutch whale-fishery was not, during the first thirty years of its existence, very profitable. This arose from the circumstance of the right to carry it on having been conceded, in 1614, to an exclusive company. The expense inseparable from such great associations, the wastefulness and unfaithfulness of their servants, who were much more in-

tent upon advancing their own interests than those of the company, increased the outlays so much, that the returns, great as they were, proved little more than adequate to defray them, and the fishery was confined within far narrower limits than it would otherwise have reached. But after various prolongations of the charter of the first company, and the formation of some new ones, the trade was finally thrown open in 1642. The effects of this measure were most salutary, and afford one of the most striking examples to be met with of the advantages of free competition. Within a few years the fishery was vastly extended; and though it became progressively more and more difficult from the growing scarcity of fish, it proved, notwithstanding these disadvantages, more profitable to the private adventurers than it had ever been to the company; and continued for above a century to be prosecuted with equal energy and success. The famous John de Witt has alluded as follows to this change in the mode of conducting the trade:

"In this respect," says he, "it is worthy of observation, that the authorized Greenland Company made heretofore little profit by their fishery, because of the great charge of setting out their ships; and that the train oil, blubber, and whale fins were not well made, handled, or cured; and being brought hither and put into warehouses, were not sold soon enough, nor to the company's best advantage. Whereas, now that every one equips their vessels at the cheapest rate, follow their fishing diligently, and manage all carefully, the blubber, train oil, and whale fins are employed for so many uses in several countries, that they can sell them with that conveniency, that though there are now fifteen ships for one that formerly sailed out of Holland on that account, and consequently each of them could not take so many whales as heretofore, and notwithstanding the new prohibition of France and other countries to import these commodities, and though there is greater plenty of them imported by our fishers—yet those commodities are so much raised in the value above what they were while there was a company, that the common inhabitants do exercise that fishery with profit, to the much greater benefit of our country than when it was (under the management of a company) carried on but by a few."—*True Interest of Holland*, p. 63, 8vo ed. London, 1746.

When in its most flourishing state, toward the year 1680, the Dutch whale-fishery employed about 260 ships and 14,000 sailors.

The English whale-fishery, like that of Holland, was originally carried on by an exclusive association. The Muscovy Company was, indeed, speedily driven from the field; but it was immediately succeeded by others that did not prove more fortunate. In 1725 the South Sea Company embarked largely in the trade, and prosecuted it for eight years; at the end of which, having lost a large sum, they gave it up. But the Legislature, having resolved to support the trade, granted, in 1732, a bounty of 20s. a ton to every ship of more than 200 tons burden engaged in it; but this premium being insufficient, it was raised, in 1749, to 40s. a ton, when a number of ships were fitted out, as much certainly in the intention of catching the bounty as of catching fish. Deceived by the prosperous appearance of the fishery, Parliament imagined that it was firmly established, and in 1777 the bounty was reduced to 30s. The effect of this reduction showed the factitious nature of the trade, the vessels engaged in it having fallen off in the course of the next five years from 105 to 33! To arrest this alarming decline, the bounty was raised to its old level in 1781, and of course the trade was soon restored to its previous state of apparent prosperity. The hostilities occasioned by the American war reduced the Dutch fishery to less than half its previous amount, and gave a proportional extension to that of England. The bounty, which had in consequence become very heavy, was reduced, in 1787, to 30s. a ton; in 1792 it was further reduced to 25s.; and in 1795 it was reduced to 20s., at which sum it continued till 1824, when it ceased.

It appears from accounts given in *MACHESON'S Annals of Commerce* (vol. iii. and iv.), that the total

bounties paid for the encouragement of the whale-fishery, in the interval between 1750 and 1788, amounted to no less than £1,577,935. It will be seen from the official account which follows, that there are no means of furnishing any accurate account of the sums paid as bounties by Great Britain from the year 1789 to 1813, inclusive; but it is, notwithstanding, abundantly certain that the total bounties paid during the period from 1789 to 1824 considerably exceeded £1,000,000.

AN ACCOUNT OF THE NUMBER OF SHIPS ANNUALLY FITTED OUT IN GREAT BRITAIN FOR THE NORTHERN WHALE FISHERY, OF THE TONNAGE AND CREWS OF SUCH SHIPS, AND OF THE BOUNTIES PAID ON THEIR ACCOUNT, FROM 1789 TO 1814.

Years.	Ship.	Tons.	Men.	Bounties paid.
1789	161	46,599	
1790	116	33,232	4492	
1791	116	33,106	4520

We have already noticed several changes of the localities in which the whale-fishery has been carried on at different periods; and within these few years others of the same kind have taken place. The Dutch fishers first began to frequent Davis's Straits in 1719; and as the whales had not hitherto been pursued into this vast recess, they were found in greater numbers than in the seas round Spitzbergen. From about this period it was usually resorted to by about three-tenths of the Dutch ships. It was not till a comparatively late period that Davis's Straits began to be frequented by English whalers; and down to 1820, when Captain Scoresby published his elaborate and valuable work on the whale-fishery, that carried on in the Greenland seas was by far the most considerable. But it will be seen from the subjoined account, that from 1826 down to 1837 the Greenland seas were nearly abandoned. This was principally a consequence of the greater abundance of whales in Davis's Straits, but it was also in part owing to the various discoveries made by the expeditions fitted out by government for exploring the seas and inlets to the westward of Davis's Straits and Baffin's Bay having made the fishers acquainted with several new and advantageous situations for the prosecution of their business. Since 1837, however, the few ships that have been sent out have gone mostly to the Greenland seas. The sea in Davis's Straits is less incommoded with field-ice than the Greenland and Spitzbergen seas, but it abounds with icebergs; and the fishery, when carried on in Baffin's Bay and Lancaster Sound, is more dangerous, perhaps, than any that has hitherto been attempted. The subjoined table shows how rapidly the Northern fishery declined down to 1842, from which period it continued nearly stationary down to 1846, when it revived a little. During the last three years there have sailed for the Northern fishery—

1850	45 ships	11,160 tons.
1851	47 "	11,935 "
1852	49 "	13,457 "

It should, however, be observed that the fishery is rather for seals than for whales; the value of the produce obtained from the former considerably exceeding the value of that obtained from the latter.

During 1852 England imported 5519 tons spermaceti oil, which were almost wholly retained for consump-

tion. During the same year the imports and exports of train oil were, respectively, 14,500 and 2757 tons.

The import duties that in various countries have been placed upon whale oil, the product of foreign fisheries, have operated against the whale-fishery. This may be seen from the following statement of the duties now (1857) in force in the principal maritime countries:

Belgium	£2 27 per hectolitre of 20½ gallons.
Brazil	15 per cent. ad valorem.
China	5 per cent. ad valorem.
France	\$10 87 per 220 pounds.
Great Britain	Free.
Hanse Towns	½ to 1 per cent. ad valorem.
Holland	Free.
Russia	52½ cents per pood of 36 pounds.
Spain	33 cents per arroba of 4¼5 gallons.
Sweden	5 cents per Hspund of 18 2½ pounds.
United States	Free.

Southern Whale-fishery.—This consists of three distinct branches; viz., 1st, the catch of the spermaceti whale, which furnishes the valuable substance called spermaceti (see the term); 2d, that of the common black whale of the Southern seas; and, 3d, that of the sea-elephant, or Southern walrus. The spermaceti whale (*Physeter macrocephalus*) is found in all tropical climates, and especially on the coasts of New Zealand and the adjoining seas. The ordinary duration of the voyage of a ship employed in this department of the fishery is about three years. The common black whale of the Southern seas (*Physeter microps*) is met with in various places, but principally on the coast of Brazil, in the bays on the west coast of Africa, and in some of the bays in New South Wales, Van Diemen's Land, etc. Sea-elephants (intermediate between the walrus of the Northern seas and the seal) are principally met with in the seas round the islands of Desolation, South Georgia, and South Shetland, the coast of California, etc. Vast numbers of these animals are annually captured; vessels frequently load entirely with them; and they are believed to furnish more oil than the common South Sea whale. The oil of the black whale and that of the sea-elephant are both known in the market by the name of Southern oil, and they are so very similar that those most versed in the trade can with difficulty distinguish the one from the other. Hence ships commonly engage indifferently in either fishing, as opportunity offers. The usual duration of the voyage of a ship from England in either of the last two departments, or in the two combined, varies from twelve to eighteen months.

The South Sea fishery was not prosecuted by the English to any extent till about the beginning of the American war; and as the Americans had already entered on it with vigor and success, four American harpooners were sent out in each vessel. In 1791 seventy-five whale ships were sent out to the South Sea; but the number has not been so great since, and latterly it has been unprosperous and declining, in consequence partly of the competition of the colonists in Australia, who are incomparably better situated for the prosecution of this branch of industry, and partly of that of the Americans. The *Macrocephalus*, or spermaceti whale, is particularly abundant in the neighborhood of the Spice Islands; and Mr. Crawford, in his valuable work on the Eastern Archipelago, entered into some details to show that the fishery carried on there was of greater importance than the spice trade. Unluckily, however, the statements on which Mr. Crawford founded his comparisons were entirely erroneous, neither the ships nor the men employed amounting to more than one-fifth or one-sixth part of what he represented. We subjoin a statement of the Southern whale-fishery carried on from Great Britain since 1819, exhibiting the total number of ships annually absent from Great Britain on whaling expeditions; the total number of ships that annually returned to Great Britain; and the annual imports of sperm and common oil, with the prices of each:

STATEMENT OF THE SOUTHERN WHALE-FISHERY CARRIED ON FROM GREAT BRITAIN SINCE 1819; EXHIBITING THE TOTAL NUMBER OF SHIPS ANNUALLY ABSENT FROM GREAT BRITAIN ON WHALING EXPEDITIONS; THE TOTAL NUMBER OF SHIPS THAT ANNUALLY RETURNED TO GREAT BRITAIN; AND THE ANNUAL IMPORTS OF SPERM AND COMMON OIL, WITH THE PRICES OF EACH.

* The ships for this and the succeeding years, as for the previous ones, do not include colonial ships, but those from Britain only.

† From this year commenced the imperial measure.

But since then the fishery has rapidly declined, and is now quite insignificant. This is seen from the following account of the ships and their tonnage cleared out for the Southern whale-fishery, viz.:

1850.....	8 ships.....	2316 tons.
1851.....	5 ".....	1905 "
1852.....	4 ".....	1503 "

French Whale-fishery.—France, which preceded the other nations of Europe in the whale-fishery, can hardly be said, for many years past, to have had much share in it. In 1784 Louis XVI. endeavored to revive the fishery. With this view he fitted out six ships at Dunkirk on his own account, which were furnished with harpooners and a number of experienced seamen brought at a great expense from Nantucket. The adventure was more successful than could have been reasonably expected, considering the auspices under which it was carried on. Several private individuals followed the example of his majesty, and in 1790 France had about forty ships employed in the fishery. The Revolutionary war destroyed every vestige of this rising trade. But since the peace, government has made great efforts for its renewal; and at present high bounties are granted to all vessels fitted out for the whale-fisheries, but especially to those engaged in the sperm fishery. These, however, have not been so successful in forcing ships into this trade as might have been anticipated; for it appears from the official accounts that in 1852 the aggregate burden of the ships cleared out for the whale-fishery amounted to only 2306 tons.—*Administration des Douanes*, 1852, p. 460; McCulloch's *Dict.*

American Whale-fishery.—For a lengthened period the Americans have prosecuted the whale-fishery with greater vigor and success than, perhaps, any other people. They commenced it in 1690, and for about fifty years found an ample supply of fish on their own shores. But the whale having abandoned them, the American navigators entered with extraordinary ardor into the fisheries carried on in the Northern and Southern oceans. From 1778 to 1785 Massachusetts employed annually 183 vessels, carrying 13,820 tons, in the former; and 121 vessels, carrying 14,026 tons, in the latter. Mr. Burke, in his famous speech on American affairs in 1774, adverted to this wonderful display of daring enterprise as follows: "As to the wealth," said he, "which the colonies have drawn from the sea by their fisheries, you had all that matter fully opened at

your bar. You surely thought these acquisitions of value, for they seemed to excite your envy; and yet the spirit by which that enterprising employment has been exercised ought rather, in my opinion, to have raised esteem and admiration. And pray, sir, what in the world is equal to it? Pass by the other parts, and look at the manner in which the New England people carry on the whale-fishery. While we follow them among the trembling mountains of ice, and behold them penetrating into the deepest frozen recesses of Hudson's Bay and Davis's Straits; while we are looking for them beneath the Arctic circle, we hear that they have pierced into the opposite region of polar cold—that they are at the antipodes, and engaged under the frozen serpent of the South. Falkland Island, which seemed too remote and too romantic an object for the grasp of national ambition, is but a stage and resting-place for their victorious industry. Nor is the equinoctial heat more discouraging to them than the accumulated winter of both poles. We learn that while some of them draw the line or strike the harpoon on the coast of Africa, others run the longitude and pursue their gigantic game along the coast of Brazil. No sea but what is vexed with their fisheries; no climate that is not witness of their toils. Neither the perseverance of Holland nor the activity of France—not the dexterous and firm sagacity of English enterprise—ever carried this most perilous mode of hardy industry to the extent to which it has been pursued by this recent people—a people who are still in the gristle, and not hardened into manhood."

United States Whale-fishery.—The first sperm whale taken by the Nantucket whalers was killed by Christopher Hussey. He was cruising near the shore for "right" whales, and was blown off some distance from the land by a strong northerly wind, when he fell in with a school of that species of whale, and killed one and brought it home.

At what date this adventure took place is not fully ascertained, but it is supposed that it was not far from 1712. This event imparted new life to the business, for they immediately began to build vessels of about forty tons, to whale out in the "deep," as it was then called, to distinguish it from "shore whaling." They fitted three vessels for six weeks, carried a few hog-heads—sufficient to contain the blubber of one whale—and tried out the oil after they returned home.

In 1715 there were six vessels engaged in the whal-

ing business—all sloops, from thirty to forty tons burden each, and which produced an income of nearly \$5000.—MACY'S *History of Nantucket*.

As the enterprise increased more capital was invested, larger vessels were built, longer voyages were made, and new localities for whales were discovered.

Fifty years later, viz., from 1771 to 1775, Massachusetts alone employed annually 183 vessels in the North Atlantic Ocean, and 121 vessels of larger burden in the South Atlantic Ocean.

The first attempt to establish the sperm-whale fishery from Great Britain was made in 1775. Nine years later the French undertook to revive the prosecution of this business. The king, Louis XVI., fitted out six ships himself from Dunkirk, and procured his experienced harpooners from Nantucket. Others emulated the example of that monarch; so that before the French Revolution that nation had forty ships in the service.

The Revolutionary war of the American colonies, and the wars of the French Revolution, nearly destroyed this flourishing branch of marine enterprise in both countries. Just previous to the war, Massachusetts employed in this service 300 vessels and 4000 seamen, about half of whom were from Nantucket alone. During that war fifteen vessels belonging to this island were lost at sea, and 134 were captured by the enemy.

It was not until the year 1782—many years after the commencement of the enterprise in Nantucket, Cape Cod, Martha's Vineyard, and other places on the Sound—that the attention of New Bedford was turned toward the whale-fishery.

From this date until the present time no permanent obstruction, with the exception of the war of 1812-'15, has occurred to impede the gradual and increasing interest given to this enterprise, and which now assumes commanding commercial importance, and develops unrivaled energy in its prosecution.

The whole number of vessels employed in the whale-fishery in this country, as before reported, is 670. Number of ships, 358; barks, 259; brigs, 17; schooners, 46. The tonnage may be put down at 220,000; value of property, at \$100 per ton, \$22,000,000.

The number of seamen engaged in this business, allowing 30 for each ship, 24 for a bark, 20 for a brig, and 18 for a schooner, would be more than 20,000.

The following are the receipts of the whale-fishery of the United States during the year 1857:

	Ships and Barks.	Brigs.	Schooners.	Barrels of Sperm.	Barrels of Whale.

The *Whalemens' Shipping List*, of New Bedford, has compiled an annual statement of the results of the whale-fishery during the year 1857, including the amount of imports and exports of oil and bone, prices-current, etc. The number of American vessels employed in the whale-fishery at present includes 587 ships and barks, 18 brigs, and 49 schooners, making an aggregate of 203,148 tons. Of this number there has been in the North Pacific Ocean about 150 ships, which is a diminution of 30 as compared with the fleet employed in that quarter in 1856. But few vessels have been added to the whaling fleet during the past year, while several have been withdrawn, and two lost—the *Newton*, of New Bedford, and the *Indian Chief*, of New London—leaving the aggregate tonnage some 665 tons less than at the beginning of the year. The quantity of oil obtained by 109 ships, whose arrivals at the Sandwich Islands have been reported, averages 808 barrels, which is not very much from the average of the preceding year. In regard to the fleet in the Okhotak Sea, the accounts are somewhat conflicting—some vessels have met with good success; while others have done comparatively nothing.

The imports of oil and bone into the United States in 1857 were brought in by 173 ships and barks, 38 brigs and schooners, of which 142 belong to the seven ports embraced in the district of New Bedford, and the remainder to various ports east of New York. We annex a comparison of the imports since 1850:

Years.	Sperm Oil. Barrels.	Whale Oil. Barrels.	Whalebone. Pounds.
1850	92,892	200,608	2,869,200
1851	99,691	928,483	3,916,500
1852	78,872	84,211	1,259,900
1853	103,077	260,114	5,652,300
1854	76,696	319,837	3,445,200
1855	72,640	184,015	2,707,500
1856	80,941	197,890	2,502,700
1857	78,440	230,941	2,058,580

It will be seen from the above that the imports of sperm oil in 1857, as compared with 1856, fall short 501 barrels, while the imports of whale oil are 33,051 barrels in excess of 1856. The increased importation of the latter during the year has arisen chiefly from shipments via Sandwich Islands from vessels which had not completed their voyages; and consequently we look for a diminished import the present year, variously estimated at from 75,000 to 100,000 barrels. Considerable shipments of bone have also arrived in the same manner, which will tend still further to reduce the import of this article the present year. The stock of sperm oil, whale oil, and whalebone in importers' and speculators' hands, on the 1st of January, 1858, is given as follows:

	Sperm Oil. Barrels.	Whale Oil. Barrels.	Whalebone. Pounds.
New Bedford	27,440	64,148	135,400
Dartmouth	180
Westport	2,500
Mattapoisett	2,409	1,260	20,800
Sippican	630
New London	820	7,463	6,500
Nantucket	2,300	2,700	..
Sag Harbor	2,510	..
Edgartown	1,000	..
Warren	115	3,242	17,800
Boston and Provincetown	1,450	2,255	5,000
Mystic	170	5,600	..
Stonington	900	..
New York	200	..	50,000
Falmouth	300
Newport	250	400	..
Fall River	58
Beverly	290	50	..
Holmes's Hole	160	600	..
Salem	85
Total	39,307	92,193	235,500

The following is a statement of the exports of oil and whalebone from the United States for two years:

Years.	Sperm Oil. Barrels.	Whale Oil. Barrels.	Whalebone. Pounds.
1856	29,052	971	2,000,784
1857	37,231	17,407	1,835,662

The increased shipments of oil during 1857, as compared with the totals for 1856, were less the result of an actual foreign demand than a desire on the part of our importers to sustain the market here by reducing the stock. The effect, however, was directly the opposite of what had been anticipated, for, by overstocking the London market, prices declined there very rapidly, and our home markets were left without the competition resulting from a domestic and foreign demand, and prices of oil declined to a lower point than they have been since 1849. The demand for bone, however, has been unusually active, owing to the fashionable propensity of the ladies to "spread," and the price of this article advanced to a higher point in 1857 than was ever before known.

We annex a comparison of the average prices of sperm oil and whalebone for seventeen years:

Years.	Sperm Oil.	Whale Oil.	Whalebone.
1841	100 c.	30½ c.	19 c.
1842	94	31½	19½
1843	78	33½	23

For articles on Whale-fishery, see *North American Review*, xxxviii. (J. R. WILLIAMS); *Hunt's Merchants' Magazine*, xiv., xvi.; *Democratic Review*, xix.; *Quarterly Review*, lxiii.; *Foreign Quarterly*, vii.; *Christian Review*, xii.; *Living Age*, xiii., xiv.; *Edinburgh Review*, lxxxvi.

Wharf, a sort of quay, constructed of wood or stone, on the margin of a roadstead or harbor, along side of which ships or lighters are brought for the sake of being conveniently loaded or unloaded.

Wharfage, the fee paid for landing goods on a wharf, or for shipping them off.

Wheat (Ger. *Weizen*; Du. *Tarw*; Da. *Hvede*; Sw. *Heete*; Fr. *Froment*, *Bled*, *Blé*; It. *Grano*, *Formento*; Sp. and Port. *Trigo*; Russ. *Pscheniza*; Pol. *Pszensia*), a species of bread-corn (*Triticum*, Linn.), by far the most important of any cultivated in Europe or North America. We are totally ignorant of the country whence this valuable grain was first derived; but it was very early cultivated in Sicily. It is raised in almost every part of the temperate zones, and in some places as high as 2000 feet above the level of the sea.

Wheat Production of the United States.—Wheat, where the soil and climate are adapted to its growth, and the requisite progress has been made in its culture, is decidedly preferred to all other grains, and, next to maize, is the most important crop in the United States, not only on account of its general use for bread, but for its safety and convenience for exportation. It is not known to what country it is indigenous, any more than our other cultivated cereals, all of which, no doubt, have been essentially improved by man. By some, wheat is considered to have been coeval with the creation, as it is known that upward of a thousand years before our era it was cultivated, and a superior variety had been attained. It has steadily followed the progress of civilization, from the earliest times, in all countries where it would grow. The introduction of this grain into the North American colonies dates back to the earliest periods of their settlement by Europeans. It was first sown, with other grains, on the Elizabeth Islands, in Massachusetts, by Gosnold, at the time he explored that coast in 1602. In 1611, wheat, as well as other grains, was also sown in Virginia; and by the year 1648 there were cultivated many hundred acres in that colony. Although premiums were offered as an encouragement of its growth in 1651, it was not much cultivated for more than a century after, in consequence of the ill-directed attention to the culture of tobacco.

Wheat was introduced into the valley of the Mississippi by the "Western Company" in 1718, where, from the careless mode of cultivating it by the early settlers, and the sudden alternations of temperature, it would only yield from five to eight fold, running to straw and blade without filling the ear. In 1746, however, the culture had so far extended, that six hundred barrels of flour were received at New Orleans from the Wabash; and by the year 1750 the French of Illinois raised three times as much wheat as they consumed, and large quantities of grain and flour were sent to the same place. Prior to the Revolution, the primitive soils of New York, New Jersey, and of New England, appear not to have rewarded the cultivation of this grain much, if any, beyond the wants of the inhabitants. Considerable quantities were raised on the Hudson, and in some parts of New Jersey and Pennsylvania, which were exported to the West Indies, and New England, and to Great Britain, France, Portugal, and Spain, in years of scarcity, previously to 1723.

In 1776 there was entailed upon this country an enduring calamity, in consequence of the introduction of the Hessian or wheat fly, which was supposed to have been brought from Germany in some straw employed in the debarkation of Howe's troops, on the west end of Long Island. From that point this insect gradually spread in various directions, at the rate of

twenty or thirty miles a year, and the wheat of the entire regions east of the Alleghenies is now more or less infested with the larvæ, as well as in large portions of the States bordering on the Ohio and Mississippi, and on the great lakes; and so great have been the ravages of these insects, that the cultivation of this grain in many places has been abandoned.

The geographical range of the wheat region in the Eastern Continent and Australia lies principally between the thirtieth and sixtieth parallel of north latitude, and between the thirtieth and fortieth degrees south, being chiefly confined to France, Spain, Portugal, Italy, Sicily, Greece, Turkey, Russia, Denmark, Norway, Sweden, Poland, Prussia, Netherlands, Belgium, Great Britain, Ireland, Northern and Southern Africa, Tartary, India, China, Australia, Van Diemen's Land, and Japan. Along the Atlantic portions of the Western Continent it embraces the tracts lying between the thirtieth and fiftieth parallels; and in the country westward of the Rocky Mountains, one or more degrees farther north. Along the west coast of South America, as well as in situations within the torrid zone, sufficiently elevated above the level of the sea and properly irrigated by natural or artificial means, abundant crops are often produced. The principal districts of the United States in which this important grain is produced in the greatest abundance, and forms a leading article of commerce, embrace the States of New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, Ohio, Kentucky, Michigan, Indiana, Illinois, Missouri, Wisconsin, and Iowa. The chief varieties cultivated in the Northern and Eastern States are the white flint, tea, Siberian, bald, Black Sea, and the Italian spring wheat; in the Middle and Western States, the Mediterranean, the Virginia white May, the blue stem, the Indiana, the Kentucky white-bearded, the old red chaff, and the Talavera. The yield varies from ten to forty bushels and upward per acre, weighing per bushel from fifty-eight to sixty-seven pounds. Within a few years a species of wheat has been introduced from Egypt, which, although it has been lying dormant two thousand years, promises to be unusually prolific. Another species from South Australia, weighing seventy pounds to the bushel, has also been introduced.

It appears that on the whole crop of the United States there was a gain, during ten years, of 15,645,000 bushels. The crop of New England decreased from 2,014,000 to 1,090,000 bushels, exhibiting a decline of 924,000 bushels, and indicating that the attention of farmers has been much withdrawn from the culture of wheat. Grouping the States from the Hudson to the Potomac, including the District of Columbia, it appears that they produced in 1849 35,085,000 bushels, against 29,986,000 in 1839. (In Virginia there was an increase of 1,123,000 bushels.) These States embrace the oldest wheat-growing region of the country, and that in which the soil and climate seem to be adapted to the permanent culture of the grain. The increase of production in the ten years has been 6,272,000 bushels, equal to 17.4 per cent. The area of tilled land in these States is 86,000,000 acres, only 80 per cent. of the number of acres returned for the whole United States, while the proportion of wheat produced is 46 per cent. of the entire crop of the country. In North Carolina there has been an increase of 170,000 bushels; but in the Southern States generally there was a considerable decrease. Indiana, Illinois, Michigan, and Wisconsin contributed to the general aggregate, under the sixth census, only 9,800,000 bushels; under the last they are shown to have produced upward of 25,000,000 bushels, an amount greater than the whole increase in the United States for the period.—*U. S. Patent Office Report*.

As a curious illustration of the fluctuations in the price of grain in Great Britain for the last two centuries we give the following table, taken from the *Encycl. Britannica*.

ACCOUNT OF THE AVERAGE PRICES OF BRITISH CORN PER IMPERIAL QUARTER, IN ENGLAND AND WALES, SINCE 1771, AS ASCERTAINED BY THE RECEIVER OF CORN RETURNS.

We give here as an interesting statement, and as showing the present liberal system of Great Britain in regard to the importation of wheat from the United States, the tariff import duties on wheat in the principal countries that import from the United States.

Countries.	Import Duties on Wheat.
Austria	Per centner (110 pounds), 16½ cents.
Belgium	18½ cents per 220 pounds.
Brazil	20 per cent. ad valorem.
Chili	25 per cent. ad valorem when under \$3 per 2½ bushels—otherwise free.
China	5 per cent. ad valorem.
Peru	75 cents per fanega of 135 bushels.

Countries.	Import Duties on Wheat.
France	Tariff regulated by average monthly prices of wheat in home market.
Great Britain	24 cents per quarter (8 bushels). North American Possessions free.
Hanse Towns	½ to 1 per cent. ad valorem.
Holland	\$3 20 for 1 last, or 85-20 bushels.
Mexico	Generally prohibited.
New Granada	Free.
Norway	1 tonde (394 bushels), 63 cents.
Spain	Generally prohibited.
Cuba	\$5 per quintal (101 pounds). 22 per cent. in favor of Spanish vessels.
Sweden	Per 4-157 bushels, 60 cents.
United States	15 per cent. ad valorem.

WHEAT AND WHEAT FLOUR (STATED AS QUARTERS OF WHEAT) IMPORTED INTO GREAT BRITAIN DURING EACH OF THE TEN YEARS ENDING WITH 1852, EXHIBITING THE QUANTITIES BROUGHT FROM EACH COUNTRY.

Wheat Trade of the Elbe, etc.—Next to Dantzic, Hamburg is, perhaps, the greatest grain market in the north of Europe, being a dépôt for large quantities of Baltic corn, and for the produce of the extensive countries traversed by the Elbe. The exports of wheat from Hamburg amounted, at an average of the eleven years ending with 1841, to 210,871 quarters a year. The price of wheat is frequently less in Hamburg than in Dantzic; but this lowness of price is altogether ascribable to the inferiority of the Holstein and Hanover wheats, which are generally met with in great abundance in Hamburg. Wheat from the Upper Elbe is of a better quality. Bohemian wheat is occasionally forwarded by the river to Hamburg; but the charges attending its conveyance from Prague amount to full 15s. a quarter, and prevent its being sent down, except when the price is comparatively high. In 1841 the shipments of wheat from Hamburg amounted to 507,400 quarters, of which 460,900 were for England.

French Wheat Trade.—It appears from the accounts given by the Marquis Garnier, in the last edition of his translation of the *Wealth of Nations*, that the price of the hectolitre of wheat at the market of Paris amounted, at an average of the nineteen years beginning with 1801 and ending with 1819, to 20 francs 53 cents, which is equal to 39 francs 80 cents the septier; or, taking the exchange at 25 francs, to 45s. 6d. the quarter. Count Chaptal, in his valuable work *Sur l'Industrie Française*, published in 1819, estimates the ordinary average price of wheat throughout France at 18 francs the hectolitre, or 42s. 10d. the quarter. The various expenses attending the importation of a quarter of French wheat into London may be taken at a medium at about 6s. a quarter. France, however, has very little surplus produce to dispose of; so that it would be impossible for her to export any considerable quantity without occasioning a great advance of price.

The mean of the different estimates framed by Vauban, Quesnay, Expilly, Lavoisier, and Arthur Young, gives 61,519,672 septiers, or 32,810,000 quarters, as the total average growth of the different kinds of grain in France (*Peuchet Statistique Élémentaire*). We, however, took occasion, in a former article on this subject, to observe that there could not be a doubt that this estimate was a great deal too low; and the more careful investigations of late French statisticians fully confirm this remark. The annual produce of the harvest of France was lately (1843) estimated, from returns obtained under official authority, at 69,558,000 hectolitres of wheat, and 112,958,000 ditto of other sorts of grain; making in all 182,517,000 hectolitres, or 62,740,000 imperial quarters. Of this quantity it is supposed that about 16 per cent. is consumed as seed, 19 per cent. in

the feeding of different species of animals, and 2 per cent. in distilleries and breweries.

The foreign grain trade of France was regulated, till within these few years, by a law which forbade exportation, except when the home prices were below certain limits, and which restrained and absolutely forbade importation, except when they were above certain other limits. The prices regulating importation and exportation differed in the different districts into which the kingdom was divided. Latterly, however, importation has been at all times allowed under graduated duties, which, like those recently existing in England, become prohibitory when the prices sink to a certain level. The frontier departments are divided into four separate districts, the prices in each district governing the duties on importation into it, so that it sometimes happens that grain warehoused in a particular port, where it is not admissible except under a high duty, has been carried to another port in another district, and admitted at a low duty. An official announcement is issued on the last day of each month, of what the duties are to be in each district during the succeeding month.

Spanish Grain Trade.—The exportation of grain from Spain was formerly prohibited under the severest penalties. But in 1820 grain and flour were both allowed to be freely exported, and in 1823 this privilege was extended to all productions (*frutos*) the growth of the soil. There is now, in fact, no obstacle whatever, except the expense of carriage, to the conveyance of grain to the sea-ports, and thence to the foreigner. Owing, however, to the grain-growing provinces being principally situated in the interior, and to the extreme badness of the roads, which renders carriage to the coast both expensive and difficult, the exports are comparatively trifling: this difficulty of carriage frequently gives rise to very great differences of prices at places in all parts of the country only a few leagues distant.

Grain Trade of Odessa.—Odessa, on the Black Sea, is the only port in southern Europe from which any considerable quantity of grain is exported. We believe, indeed, that the fertility of the soil in its vicinity has been much exaggerated; but the wheat shipped at Odessa is principally brought from Volhynia and the Polish provinces to the south of Cracow, the supplies from which are susceptible of an indefinite increase. Owing to the cataracts in the Dnieper, and the Dniester having a great number of shallows, most part of the grain brought to Odessa comes by land carriage. The expense of this mode of conveyance is not, however, nearly so great as might be supposed. The carts with grain are often in parties of 150; the oxen are pas-

tured during the night, and they take advantage of the period when the peasantry are not occupied with the harvest, so that the charge on account of conveyance is comparatively trifling.

Both soft and hard wheat are exported from Odessa; but the former, which is by far the most abundant, is only brought to England. Supposing British wheat to sell at about 60s., Odessa wheat in good order would not be worth more than 52s. in the London market; but it is a curious fact, that in the Mediterranean the estimation in which they are held is quite the reverse; at Malta, Marseilles, Leghorn, etc., Odessa wheat fetches a decidedly higher price than British wheat.

The hard wheat brought from the Black Sea comes principally from Taganrog. It is a very fine species of grain; it is full 10 per cent. heavier than British wheat, and has less than half the bran. It is used in Italy for making macaroni, vermicelli, and things of that sort; little of it has found its way to England.

The voyage from Odessa to Britain is of uncertain duration, but generally very long. It is essential to the importation of wheat in a good condition, that it should be made during the winter months. When the voyage is made in summer, unless the wheat be very superior, and be shipped in exceedingly good order, it is almost sure to heat, and has sometimes, indeed, been injured to such a degree as to require to be dug from the hold with pick-axes. Unless, therefore, means be devised for lessening the risk of damage during the voyage, there is little reason to think that Odessa wheat will ever be very largely imported into Britain.

The entire expense of importing a quarter of wheat from Odessa to London may be estimated at from 16s. to 18s. The exports of wheat from Odessa, and other ports on the Black Sea, to Constantinople, the Levant, Italy, the south of France, etc., have latterly been very large indeed. In 1846 the exports from Odessa only amounted to 1,279,502 quarters, and in 1847 to 2,016,692 ditto: the latter being, we believe, the largest exportation that ever took place in a single year from any single port. Owing to the scarcity in England, above 400,000 quarters of the above quantity were shipped for that country, but the speculation entailed a heavy loss on the importers. The price free on board at Odessa considerably exceeded 40s. a quarter.—E. B.

United States.—When we see the growth of wheat keeping up with the progress of population in the oldest States of the Union, we need have no apprehension of a decline in the cultivation of this important crop. The amount of flour exported from New Jersey in 1751 was 6424 barrels; from Philadelphia, in 1752, 125,960 barrels, besides 86,500 bushels of wheat; in 1767, 198,816 barrels, besides 367,500 bushels of wheat; in 1771, 252,744 barrels; from Savannah, in 1771, 7200 pounds; from Virginia, for some years annually preceding the Revolution, 800,000 bushels of wheat. The total exports of flour from the United States in 1791 were 619,681 barrels, besides 1,018,339 bushels of wheat; in 1800, 653,052 barrels, besides 26,853 bushels of wheat; in 1810, 798,431 barrels, besides 325,924 bushels of wheat; in 1820-21, 1,056,119 barrels, besides 25,821 bushels of wheat; in 1830-31, 1,806,529 barrels, besides 408,910 bushels of wheat; in 1840-41, 1,515,817 barrels, besides 868,585 bushels of wheat; in 1845-46, 2,289,476 barrels, besides 1,613,795 bushels of wheat; in 1846-47, 4,382,496 barrels, besides 4,899,951 bushels of wheat; in 1850-51, 2,202,335 barrels, besides 1,026,725 bushels of wheat. According to the census of 1840, the wheat crop of the United States amounted to 84,823,272 bushels; in 1849, according to the census of 1850, 100,503,899 bushels, although in some of the largest wheat-growing States the crop of 1849 fell far below the average. The production of the year 1857 in the United States is estimated at about 200,000,000 of bushels.

In the State of Ohio, especially, there was great deficiency, as was made apparent by the returns of the

wheat crop for the ensuing year, made in pursuance of an act of the Legislature of that State. From the almost universal returns of "short crop" by the marshals in that State in 1849, which fell below that of 1839, 2,000,000 bushels, and the ascertained crop of 1850, we are fully satisfied that the average wheat crop of Ohio would appear 80 per cent. greater than shown by the census returns. The same causes which operated to diminish the wheat crop of Ohio, were not without their effects upon that of other States bordering on the upper portion of the valley of the Mississippi.

In the London exhibition very little wheat was exhibited equal to that from the United States, especially that from Genesee county, in the State of New York—a soft, white variety—to the exhibitor of which a prize medal was awarded by the Royal Commissioners, and recently transmitted to Mr. Bell by the President of the United States, the chairman of the American Executive Committee. The red Mediterranean wheat exhibited from the United States attracted much attention. The wheat from South Australia was probably superior to any exhibited, while much from our own country fell but little behind, and was unquestionably next in quality.—*Patent Office Report.*

EXPORTS OF FOREIGN WHEAT AND FLOUR FROM THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1857.

Whither exported.	Wheat.	Wheat Flour.	
	Bushels.	Value.	Cwt. Value.
England	35,670	\$56,302	45,985 \$210,203
Scotland	540 1,925
British N. Am. Poss.	3,355 14,449
Spain on the Atlantic	6,173	11,113	...
China	500 2,100
Total	41,843	\$67,415	50,580 \$228,677
From warehouse	10,678	\$17,084	2,562 \$10,248
Not from warehouse	31,165	50,331	47,918 218,429

The imports of wheat into the United States are merely nominal, being, for the year ending June 30, 1857, as follows:

Whence imported.	Bushels.	Value.
Hamburg	334	\$38
Sandwich Islands	300	294
Other places	24	27
Total	658	\$909

Formerly the export of breadstuffs from the United States was principally made up of flour, but of late years it has been found advantageous to ship wheat in bulk, especially from the interior grain markets, without transshipment; and, as may be seen from the preced-

ing statement, at present the export of wheat is nearly equal that of flour.

The consumption of the country, per the census figures of product, population, and export, for the years 1840 and 1850, and the rate of increase in population being known, the results are as follows:

Years.	Population.	Consumption at 3½ Bushels.	Actual Export.
1840	17,069,656	64,565,447	11,198,018
1850	23,267,726	64,182,986	8,827,017
1851	24,023,916	64,483,895	12,943,490
1852	24,780,106	66,730,815	18,600,680
1853	25,536,296	89,877,025	18,953,960
1854	26,292,486	93,023,690	28,148,595
1855	27,048,673	94,670,355	7,821,584
1856	27,804,863	97,317,020	30,000,000

Years.	Seed.	Crop.	Price in New York.
1840	8,482,727	84,827,272	\$5.44
1850	11,479,922	104,479,923	\$6.62
1851	12,000,000	110,032,294	6.63

Whip, in sea language, a rope passed through a single block or pulley.

Whirlpool, a vortex, eddy, or gulf, where the water has a circular motion. Whirlpools are produced by the meeting of currents which run in different directions. Their danger to navigation is well known, but is, perhaps, not equal to the dread which sailors entertain of them. Some of the most celebrated are the Euriplus, near the coast of Negropont; the Charybdis, in the Straits of Sicily; and the Maelstrom, on the northern coast of Norway.

Whirlwind, a revolving column or mass of air, supposed with most probability to be produced by the meeting of two currents of air blowing in opposite directions, but ascribed by some to electricity. It is analogous to the *whirlpool*. When the opposite currents have the same velocity, the circulation will be maintained at the same spot; but if the motion of one of them is more rapid than that of the other, it will transport the whirling motion with its excess of celerity, and a progressive and rotatory motion are thus maintained at the same time. Whirlwinds generally occur in summer, and are most violent in tropical countries, where they frequently produce most destructive effects.

Whisky, a spirit obtained by distillation from corn, sugar, or molasses, though generally from the former. Whisky is the *national spirit*, if we may so term it, of Scotland and Ireland; but that distilled in the former is generally reckoned superior to that of the latter.—See *SPIRITS*. Whisky is a corruption of the Irish word *uisquebaugh*. This ardent spirit may be manufactured from barley malt alone; from the raw or unmalted barley mixed with from a third to a ninth of malt; from a mixture of raw barley, wheat, rye, or oats, with from a sixth to a tenth of barley malt; or from a mixture of raw barley, or big, with sugar; or from sugar or molasses alone. When barley malt is alone used, the processes are simple, and the spirit produced has a more agreeable flavor, and is more esteemed; but, in consequence of the heavy duty on malt, distillers have been induced to employ large quantities of

unmalted grain, and of late years no small proportion of sugar and molasses, adding merely enough of malt to induce the chemical conversion of the starch in the unmalted grain into grape sugar.

During the germination of barley (as in its conversion into malt) a peculiar substance is generated in the grain called *diastase*, which acts chemically on the starch of the grain, converting it first into a kind of gum called *dextrine*, and then into a sweet substance identical in composition with grape sugar. It has been found that this diastase can convert 2000 parts of starch into grape sugar; and it is of this valuable property that the distiller avails himself when he adds malt to his raw grain. To save the more expensive article malt, he uses only so much as experiment has proved will suffice to change the starch of the raw grain into sugar when mixed with it in his mash-tun. The distiller, therefore, to prepare the saccharine fluid for his operations, has to go through all the processes of brewing before he gets it ready for the still.—See *article BREWING*.

The Manufacture of Whisky.—Cincinnati has become the greatest whisky market in the world, and the Ohio Valley the most important whisky-producing region with which we are acquainted. The distilleries in the vicinity of Cincinnati are on a large scale, and they are said to exhibit many improvements devised by inventive genius. Steam is made to perform nearly all the labor. Few men are employed, and they do little else than look at the machines as they perform the work. The quantity of corn consumed in a single distillery in Cincinnati is about one thousand bushels per day, from which about 4000 gallons of whisky are produced. This gives for this single establishment a consumption of 312,000 bushels of corn per annum, and a production of 1,248,000 gallons of whisky. We have not the data upon which to base an estimate of the quantity of whisky produced in the Ohio Valley. The quantity sold in the Cincinnati market annually is about 220,000 barrels, or about 9,000,000 gallons. This is probably not more than one half the production of Ohio and Indiana alone. We presume that the production is 18,000,000 gallons, and find the consumption of corn averaging four and a half million bushels. It is probable that the production of whisky in the Ohio Valley is 50,000,000 gallons per annum, involving a consumption of 12,500,000 bushels of corn, the average value of which is \$5,000,000. The demand for the article is great, and daily increasing.

White Sea. The entrance to the port of Archangel, situated on the right bank of the Dwina, about thirty miles from its mouth, is interrupted by a bar, over which vessels drawing more than fourteen feet of water can not pass. Larger ships discharge and load outside the bar. The trade of Archangel extends as far as Siberia, and along the coasts of the White Sea, east and west. Previous to the founding of St. Petersburg this was the only place of maritime commerce in the empire. Since that period its trade has considerably declined. The River Dwina is connected with the Volga and Neva by canals; but, owing to the rigor of the climate, the port of Archangel is open only from July to September. Its imports consist of colonial goods, salt, woollens, and hardwares. In 1852 there entered this port 715 vessels, with an aggregate of 56,922 tons; of which 85 were laden and 630 in ballast. These all cleared with freight. Of the arrivals there were under the English flag 273 vessels, with an aggregate tonnage of 24,297 tons.

	Archangel.	Other Ports.
Imports in 1852	1,252,000	201,000
Exports in 1852	20,851,000	556,000
Total, year 1852.....	22,103,000	757,000

Total custom-house receipts from the five ports of the White Sea, in 1852, 984,000 francs. These ports are Archangel, Oneg, Kola, Kemi, Sounsky. The imports of Archangel consist of dry and salted fish, sugar,

wines, and other liquors, salt, and peltries. The exports are flax, linens, linseed, timber, tar, etc.

Wigs. The wig-trade is one of the most curious connected with manufactures in hair. The French are famous in this department. There is a regular hair-harvest in some of the central districts of France; Paris firms send agents into those districts in the spring of the year, who purchase the beautiful tresses which the country maidens have been cultivating for that purpose; this hair-crop is as much an annual affair as a corn-crop in the fields. The price paid is about three-pence (English) per ounce; but the agents usually pay for the hair with ribbons, handkerchiefs, and other trinkets, at fairs and markets. Not the least curious feature is, that the agents can distinguish the hair of one district from that of another not far distant—an ethnographical feat which might puzzle a learned naturalist—and attach a money value to this difference. If it be true, as is asserted, that two hundred thousand pounds' weight of women's hair is thus annually sold in the country districts of France, it must be admitted to form a very singular kind of commerce. The agents sort and clean the hair, and then dispose of it to the Paris firms at about double the former price. Then comes the art of the *peruquier* to fashion this hair into wigs, perukes, and scalps—some of which command a very high price. Of the "transparent wigs," the "ventilating wigs," the "bald white wigs," the "gossamer-parting wigs," the "fronts with each hair fixed separately," and other wonders of wig-making, we have been abundantly informed by our advertising *peruquiers*.

Wind-mills. They are of great antiquity, and some writers state them to be of Roman invention; but certainly we are indebted for the wind-mill to the Saracens. They are said to have been originally introduced into Europe by the knights of St. John, who took the hint from what they had seen in the crusades.—BAKER! Wind-mills were first known in Spain, France, and Germany, in 1299.—ANDERSON. Wind saw-mills were invented by a Dutchman in 1633, when one was erected near the Strand, in London.

Windows. See GLASS. There were windows in Pompeii, A.D. 79, as is evident from its ruins. It is certain that windows of some kind were glazed so early as the third century, if not before, though the fashion was not introduced until it was done by Bennet, A.D. 633. Windows of glass were used in private houses, but the glass was imported, 1777.—ANDERSON. In England about 6000 houses now have fifty windows and upward in each; about 275,000 have ten windows and upward; and 725,000 have seven windows, or less than seven. The window-tax in England was first enacted in order to defray the expense of and deficiency in the re-coinage of gold, 7 William III., 1695.

Winds. The prevailing winds in the Caribbean Sea and southern parts of the Gulf of Mexico are the northeast trade-winds. They have their offices to perform in the river basins of inter-tropical America, and the rains which they may discharge into the Mississippi Valley now and then are exceptions, not the rule. The winds from the north can not bring vapors from the great lakes to make rains for the Mississippi, for two reasons: 1st. The basin of the great lakes receives from the atmosphere more water in the shape of rain than they give back in the shape of vapor. The St. Lawrence River carries off the excess. 2d. The mean climate of the lake country is colder than that of the Mississippi Valley, and therefore, as a general rule, the temperature of the Mississippi Valley is unfavorable for condensing vapor from that quarter. It can not come from the Atlantic, because the greater part of the Mississippi Valley is to the windward of the Atlantic. The winds that blow across this ocean go to Europe with their vapors; and in the Pacific, from the parallels of California down to the equator, the direction of the wind at the surface is from, not toward,

the basin of the Mississippi. Therefore it seemed to be established with some degree of probability, or, if that expression be too strong, with something like apparent plausibility, that the rain winds of the Mississippi Valley do not, as a general rule, get their vapors from the North Atlantic Ocean, nor from the Gulf of Mexico, nor from the great lakes; nor from that part of the Pacific Ocean over which the northeast trade-winds prevail.

Southeast Trade-winds.—After the northeast trades have blown out their season, which in India ends in April, the great arid plains of Central Asia, of Tartary, Thibet, and Mongolia, become heated up; they rarefy the air of the northeast trades, and cause it to ascend. This rarefaction and ascent, by their demand for an indraught, are felt by the air which the southeast trade-winds bring to the equatorial Doldrums of the Indian Ocean: it rushes over into the northern hemisphere to supply the upward draught from the heated plains as the southwest monsoons. The forces of diurnal rotation assist to give these winds their westing. Thus the southeast trades, in certain parts of the Indian Ocean, are converted, during the summer and early autumn, into southwest monsoons. These then come from the Indian Ocean and Sea of Arabia loaded with moisture, and, striking with it perpendicularly upon the Ghauts, precipitate upon that narrow strip of land between this range and the Arabian Sea an amount of water that is truly astonishing. Here, then, are not only the conditions for causing more rain, now on the west, now on the east side of this mountain range, but the conditions also for the most copious precipitation. Accordingly, when we come to consult rain-gauges, and to ask meteorological observers in India about the fall of rain, they tell us that on the western slopes of the Ghauts it sometimes reaches the enormous depth of twelve or fifteen inches in one day. Were the Andes stretched along the eastern instead of the western coast of America, we should have an amount of precipitation on their eastern slopes that would be truly astonishing; for the water which the Amazon and the other majestic streams of South America return to the ocean would still be precipitated between the sea-shore and the crest of these mountains. These winds of India then continue their course to the Himalaya range as dry winds. In crossing this range, they are subjected to a lower temperature than that to which they were exposed in crossing the Ghauts. Here they drop more of their moisture in the shape of snow and rain, and then pass over into the thirsty lands beyond with scarcely enough vapor in them to make even a cloud. Thence they ascend into the upper air, there to become counter-currents in the general system of atmospherical circulation.

Rain-winds are the winds which convey the vapor from the sea, where it is taken up, to other parts of the earth, where it is let down either as snow, hail, or rain. As a general rule, the trade-winds may be regarded as the evaporating winds; and when, in the course of their circuit, they are converted into monsoons, or the variables of either hemisphere, they then generally become also the rain-winds—especially the monsoons—for certain localities. Thus the southwest monsoons of the Indian Ocean are the rain-winds for the west coast of Hindostan. In like manner, the African monsoons of the Atlantic are the winds which feed the springs of the Niger and the Senegal with rains. Upon every water-shed which is drained into the sea, the precipitation, for the whole extent of the shed so drained, may be considered as greater than the evaporation, by the amount of water which runs off through the river into the sea. In this view, all rivers may be regarded as immense rain-gauges, and the volume of water annually discharged by any one as an expression of the quantity which is annually evaporated from the sea, carried back by the winds, and precipitated throughout the whole extent of the valley that is drain-

ed by it. Now, if we knew the rain-winds from the dry, for each locality and season generally throughout such a basin, we should be enabled to determine, with some degree of probability at least, as to the part of the ocean from which such rains were evaporated. And thus, notwithstanding all the eddies caused by mountain chains and other uneven surfaces, we might detect the general course of the atmospherical circulation over the land as well as the sea, and make the general courses of circulation in each valley as obvious to the mind of the philosopher as is the current of the Mississippi, or of any other great river, to his senses.

These investigations as to the rain-winds at sea indicate that the vapors which supply the sources of the Amazon with rain are taken up from the Atlantic Ocean by the northeast and southeast trade-winds; and many circumstances, some of which have already been detailed, tend to show that the winds which feed the Mississippi with rains get their vapor in the southeast trade-wind region of the other hemisphere. For instance, we know from observation that the trade-wind regions of the ocean, beyond the immediate vicinity of the land, are, for the most part, rainless regions, and that the trade-wind zones may be described, in a hyetographic sense, as the evaporating regions. They also show, or rather indicate, as a general rule, that, leaving the polar limits of the two trade-wind systems, and approaching the nearest pole, the precipitation is greater than the evaporation until the point of maximum cold is reached.

And we know also that, as a general rule, the southeast and northeast trade-winds, which come from a lower and go to a higher temperature, are the evaporating winds, i. e., they evaporate more than they precipitate; while those winds which come from a higher and go to a lower temperature are the rain-winds, i. e., they precipitate more than they evaporate. That such is the case, not only do researches indicate, but reason teaches, and philosophy intimates. These views, therefore, suggest the inquiry as to the sufficiency of the Atlantic, after supplying the sources of the Amazon and its tributaries with their waters, to supply also the sources of the Mississippi and the St. Lawrence, and of all the rivers, great and small, of North America and Europe. A careful study of the rain-winds, in connection with the *Wind and Current Charts*, will probably indicate to us the "springs in the ocean" which supply the vapors for the rains that are carried off by those great rivers. "All the rivers run into the sea; yet the sea is not full; unto the place from whence the rivers come, thither they return again."—MAURY'S *Phys. Geog.*

Wind-sails, in a ship, are made of common sailcloth, and are usually twenty-five and thirty feet long according to the size of the ship, and are of the form of a cone ending obtusely. When they are made use of, they are hoisted by ropes to about two-thirds or more of their height, with their bases distended circularly, and their apex hanging downward in the hatchways of the ship. Above each of these one of the common sails is so disposed that the greatest part of the air rushing against it is directed into the wind-sail, and conveyed into the body of the ship, to produce ventilation, etc.

Windward, in sea-language, denotes any thing toward that point from whence the wind blows, in respect of a ship: thus windward tide is the tide which runs against the wind.

Wine (Ger. *Wein*; Fr. *Vin*; It. and Sp. *Vino*; Port. *Vinho*; Russ. *Wino*, *Winogradnoe winoe*; Lat. *Vinum* Gr. *Oinos*; Arab. *Khumr*), the fermented juice of the grape, or berries of the vine (*Vitis vinifera*). The vine is indigenous to Persia and the Levant; but it is now found in most temperate regions. The limits within which it is cultivated in the northern hemisphere of the Old World vary from about 15° to 43° and 52°; but in North America it is not cultivated farther

north than 38° or 40°. It is rarely grown at a greater altitude than 3000 feet. From Asia the vine was introduced into Greece, and thence into Italy. The Phœceans, who founded Marseilles, carried the vine to the south of France; but it is doubtful whether it was introduced into Burgundy till the age of the Antonines. The ancient writers give the most contradictory accounts with respect to the introduction of the vine into Gaul.—See the learned and excellent work of LE GRAND D'AUSSEY, *Vie Privée des Français*. The species of *Vitis* indigenous to North America is very different from the *Vitis vinifera*. In favorable seasons the vine ripens in the open air in England; and in the 11th and 12th centuries considerable quantities of inferior wine were made from native grapes. Vineyards are now, however, unknown in Great Britain; but the grapes raised in hot-houses, and used in desserts, are excellent. The vine grows in every sort of soil; but that which is light and gravelly seems best suited for the production of fine wines. It succeeds extremely well in volcanic countries. The best wines of Italy are produced in the neighborhood of Vesuvius; the famous Tokay wine is also made in a volcanic district, as are several of the best French wines; many parts of the south of France bearing evident marks of extinct volcanoes. Hermitage is grown among the *débris* of granite rocks. The most favorable situation for a vineyard is upon a rising ground or hill facing the southeast, and the situation should not be too confined;

—apertus
Bacchus amat colles.

The art of expressing and fermenting the juice of the grape appears to have been practiced from the remotest antiquity. The sacred writings tell us that Noah planted a vineyard soon after the deluge (*Gen. ix. 20*); and a modern Latin poet ingeniously represents the vine as a gift from Heaven, to console mankind for the miseries entailed upon them by that grand catastrophe!

Omnia vastatis ergo quum cerneret arvis
Desolata Deus, nobis felicia vini
Dona dedit; tristes hominum quo munere fovit
Reliquias, mundi solatus vitæ ruinam!

Vanierii *Prod. Rusticum*, lib. xi.

Species of Wine.—There are many varieties of vines; and this circumstance, combined with differences of soil, climate, mode of preparation, etc., occasions an extreme variety in the species of wine. But between places immediately contiguous to each other, and where even a careful observer would hardly remark any difference, the qualities of the wines, though produced by the same species of grape, and treated in the same way, are often very different. A great deal evidently depends upon the aspect of the vineyard; and it is probable that a good deal depends on peculiarities of soil. But whatever may be the cause, it is certain that there are wines raised in a few limited districts, such as Tokay, Johannisberger, Constantia, the best Burgundy, Champagne, Claret, etc., that no art or care has hitherto succeeded in producing of equal goodness in other places.

The leading character of wine must be referred to the alcohol which it contains, and upon which its intoxicating powers principally depend; not exclusively, however; for some of the lighter wines, if brisk and effervescent, seem to derive from the admixture of carbonic acid a peculiar exhilarating power not directly proportional to their alcoholic contents. And again, we find other wines, among which certain Burgundies stand foremost, which are eminently heating, though not very strong. The following table shows the quantity of alcohol (of the specific gravity of 825 at 60°), by measure, contained in 100 parts by measure of the respective wines. Some other vinous and spirituous liquors have been added, for the purpose of showing the relation which they bear to wine in the proportion of alcohol which they contain.

It is necessary, however, to observe that the proportion of alcohol in the same wine varies materially according to the age of the wine and other circumstances, and that wines having the same quantities of alcohol in each may, notwithstanding, differ essentially in every other respect. Practically wines are distinguished by their color, hardness or softness on the palate, their aroma, and their being still or effervescing. In many cases, too, the same variety of wine may be distinguished into a number of sub-varieties, differing more or less in one or more of these particulars. Thus, in the case of Champagne, some varieties are red, and others white or straw-colored; some are dry and others sweet; the aroma of one variety differs from that of another; and, while some are still, others have every different degree of effervescing power. The same variety exists in the case of clarets, and, indeed, of almost every description of wine.

The differences in the qualities of wines depend partly on differences in the vines, but more on the differ-

ences of the soils in which they are planted, in the exposure of the vineyards, and in the treatment of the grapes, and the mode of manufacturing the wine. Though the vine grows in every sort of soil, a rising ground, or gently-sloping hill facing the south, with a loose, gravelly, or rather volcanic soil, is by far the best situation for a vineyard. It is in such situations that all the finest wines are produced.

It would be useless, in a work of this kind, to attempt characterizing the different sorts of wine used. Port and sherry have long enjoyed a decided preponderance in the markets; and it must be admitted that, when of good quality and sparingly used, they are very unexceptionable wines. But they are often harsh, and have the disadvantage of being strong and heating, so that they can not be taken, to any thing like excess, by most persons with impunity. They are well enough for a glass or two, but they are not wines for conversation or society. It is not probable, indeed, had it not been for the high differential duties with which French wines were so long burdened, that the use of port and sherry would ever have been so general; and since the abolition of the differential duty in 1831, French wines have begun gradually, though slowly, to make their way from the highest, to which they have hitherto been mostly confined, among the middle classes. They are, indeed, superior in almost all respects to every other variety. The best growths of claret, Champagne, and Burgundy, seem to unite all the qualities required to constitute perfect wines. Had they been known in antiquity, we apprehend they would have engrossed most part of the praise so profusely lavished on the Pramnian, Cecuban, Falernian, and other renowned wines of Greece and Rome.—BRANDE'S Dict.

Ancient Wines.—The wines of Lesbos and Chios among the Greeks, and the Falernian and Cecuban among the Romans, have acquired an immortality of renown. Great uncertainty, however, prevails as to the nature of these wines. Dr. Henderson thinks that the most celebrated of them all, the Falernian, approached, in its most essential characters, near to Madeira. In preparing their wines, the ancients often inspissated them till they became of the consistence of honey, or even thicker. These were diluted with water previously to their being drunk; and, indeed, the habit of mixing wine with water seems to have prevailed much more in antiquity than in modern times.

Modern Wines.—The principal wines made use of in England are port, sherry, claret, Champagne, Madeira, hock, Marsala, Cape, etc.

Port, the after-dinner wine, is produced in the province of Upper Douro, in Portugal; and is shipped at Oporto, whence its name. When it arrives in England, it is of a dark purple or inky color; has a full, rough body, with an astringent bitter-sweet taste, and a strong flavor and odor of brandy. After it has remained some years longer in the wood, the sweetness, roughness, and astringency of the flavor abate; but it is only after it has been kept 10 or 15 years in bottle that the odor of the brandy is completely subdued, and the genuine aroma of the wine developed. When kept too great an age, it becomes tawny, and loses its peculiar flavor. During the process of melioration, a considerable portion of the extractive and coloring matter is precipitated on the sides of the vessels in the form of crust. In some wines this change occurs much earlier than in others. A large quantity of brandy is always mixed with the wine shipped from Oporto for England. Genuine unmixed port-wine is very rarely met with. We have been so long accustomed to the compounded article, that, were it possible to procure it unmixed, it is doubtful whether it would be at all suited to our taste. According to Mr. Brande's analysis, on which, however, owing to the differences in the quality of the wine, no great stress can be laid, port, as used in England, contains about 23 per cent. of alcohol.

Oporto Wine Company.—The quality of the wine shipped from Oporto has been materially injured by the monopoly so long enjoyed by the Oporto Wine Company. This company was originally founded in

1756, during the administration of the Marquis Pomal. A certain extent of territory was marked out by its charter as the only district on the Douro in which wine could be raised for exportation: the absolute disposal of the wines raised in this district was placed in the hands of the company, who were further authorized to fix the prices to be paid for them to the cultivators, to prepare them for exportation, and to fix the price at which they should be sold to foreigners! It is obvious that a company with such powers could not be any thing else than an intolerable nuisance. What could be more arbitrary and unjust than to interdict the export of all wines raised out of the limits of the company's territory? But even in its own district, its proceedings were oppressive and injurious. The company annually fixed, by a fiat of their own, two rates of prices—one for the *vinho de feitoria*, or wine for exportation; the other for *vinho de ramo*, or wine for home consumption—at which the cultivators were to be paid, whatever might be the quality of their wines. They had, therefore, no motive to exert superior skill and ingenuity; but contented themselves with endeavoring to raise, at the least possible expense, the greatest supply of *vinho de feitoria*, for which the company allowed the highest price. All emulation was thus effectually extinguished, and the proprietors who possessed vineyards of a superior quality adulterated their wines with inferior growths, so as to reduce them to the average standard. "In this way," says Dr. Henderson, "the finer products of the Douro vintages have remained, in a great measure, unknown to us; and port-wine has come to be considered as a single liquor, if I may use the expression, of nearly uniform flavor and strength; varying, it is true, to a certain extent in quality, but still always approaching to a definite standard, and admitting of few degrees of excellence. The manipulations, the admixtures—in one word, the adulterations—to which the best wines of the Cimo do Douro are subjected, have much the same effect as if all the growths of Burgundy were to be mingled in one immense vat, and sent into the world as the only true Burgundian wine. The delicious produce of Romanée, Chambertin, and the Clos Vougeot, would disappear, and in their places we should find nothing better than a second-rate Beaune or Macon wine."—*History of Ancient and Modern Wines*. Not only, however, did the Oporto Wine Company deteriorate the quality, but they also raised the price of their wines to an enormous height. Secured against the competition of their countrymen, and enjoying down to 1831 a nearly absolute monopoly of the British markets for red wines by means of the high duties on those of France, they filled their pockets at our expense. At the very moment when the company were shipping wine for England at £40 a pipe, they frequently shipped the same wine to other countries at £20.—FLEETWOOD WILLIAMS on the Wine Trade. And the authentic tables published by Balbi show that the price of wine was trebled and quadrupled under the management of this corporation.—*Essai Statistique sur le Royaume de Portugal*.

It is long since the injurious influence of the company on the commerce of England was distinctly perceived and pointed out. So far back as 1767, the Board of Trade laid a memorial before his majesty in council, in which they state, "With respect to many particular regulations of the Oporto Company, which we think justly objected to by the merchants as highly grievous and oppressive, we have not thought it necessary to enter into a minute description of them, being of opinion that one general and fatal objection lies against them all; viz., that they all contribute to establish in the company a monopoly against your majesty's subjects from which by treaty they have a right to be exempted." But notwithstanding this authoritative exposition of the injury done to the English by this monopoly, and the experience which every subse-

quent year afforded of its mischievous influence, such was the inveteracy of ancient prejudice, that it was not till 1831 that we took that step which, had it been taken a century before, would have rid ourselves of its evils as well as a host of others, by equalizing the duties on French and Portuguese wines, and putting an end to the injurious preference given to the latter by the Methuen treaty. In 1833 Don Pedro, whose daughter had been raised to the Portuguese throne mainly by the intervention of the English, issued a decree abolishing the Old Oporto Company. And it might have been supposed that once abated, the nuisance would not have been again revived. But such was not the case. A new wine company was subsequently established, with privileges little less oppressive than those of the old company. And as the taste for French wine had made little progress among us in the interval, we suffered from the monopoly and adulterations practiced and sanctioned by the new company, as we had done from those of its predecessor. Its mischievous influence being further aggravated by a heavy export duty on wine shipped to any port in Europe, was latterly so intolerable, that to defeat it considerable quantities of port were imported by the circuitous route of the United States. However, the firm remonstrances of the British government, and the growing dissatisfaction of the Portuguese themselves, have at length succeeded in establishing a more equitable and less illiberal system. In October 1852, the new company was abolished, equal duties (about 14s. a pipe) were imposed on all wines exported, and considerable, though not entire, freedom was given to the trade.—For further details, see article OPORTO.

Sherry is of a deep amber color; when good, it has a fine aromatic odor; its taste is warm, with some degree of the agreeable bitterness of the peach kernel. When new, it tastes harsh and fiery; it is mellowed by being allowed to remain 4 or 5 years or longer in the wood; but it does not attain to its full flavor and perfection until it be kept for 15 or 20 years. It is a very strong wine, containing about 19 per cent. of alcohol. It is principally produced in the vicinity of Xeres, not far from Cadiz, in Spain. It is very extensively used in England as a dinner wine. Dry sherry, or *amontillado*, when genuine and old, fetches a very high price. Perhaps no wine is so much adulterated as sherry. With the exception of Marsala, the consumption of sherry has been far more influenced than that of any other wine by the reduction of the duties in 1825. In 1852 the quantity retained for home consumption amounted to 2,606,857 gallons, being 458,000 gallons more than double the quantity retained for consumption at an average of 1823 and 1824.

The province of Valencia, in Spain, produces a great variety of wines. Large quantities of a strong, sweetish red wine, called Benicarlo, from the port whence it is shipped, is exported to Cetta. It is thence conveyed, by the Canal of Languedoc, to Bordeaux, where it is mixed up with the poorer sorts of the wines of the Gironde, to which it gives color, body, and durability. The *Val de Peñas*, a pleasant red wine of La Mancha, said by Swinburne to be "the most drinkable, for common use, of any in Spain" (*Travels in Spain*, p. 319, 4to ed.), has probably been commended beyond its deserts. But in whatever estimation it may be held in its native province, we doubt whether it is ever likely to be acceptable to foreigners. When carried to the coast, it is conveyed in goat skins smeared with pitch. This gives it the *olor de bota*, by which it is disagreeably distinguished.

Claret, the term generally used in England, though not in France, to designate the red wines, the produce of the Gironde. Of these, Lafitte, Latour, Château-Margaux, and Haut-Brion, are so generally and deservedly esteemed, that they always sell at 20 to 30 per cent. higher than any others of the department. The first-mentioned is the most choice and delicate,

and is characterized by its silky softness on the palate, and its charming perfume, which partakes of that of the violet and the raspberry. The Latour has a fuller body, and at the same time a considerable aroma, but wants the softness of the Lafitte. The Château-Margaux, on the other hand, is lighter, and possesses all the delicate qualities of the Lafitte, except that it has not quite so high a flavor. The Haut-Brion, again, has more spirit and body than any of the preceding, but is rough when new, and requires to be kept six or seven years in the wood; while the others become fit for bottling in much less time.

Among the second-rate wines, that of Rozan, in the parish of St. Margaux, approaches in some respects to the growth of the Château-Margaux; Gorce, in the same territory, is little inferior to Latour; and the vineyards of Leoville, Larose, Bran-Mouton, Pichon-Longueville, and Calon, in the canton of Pauillac, afford wines of good flavor, which, in favorable years, have much of the excellence of the finer growths, from which, indeed, some of the best can with difficulty be distinguished. Among the third and fourth class wines are those of Pauillac, St. Julien de Regnac, St. Estephe, Canon, St. Emilion, the wines of Haut Medoc, etc. These have each some distinguishing peculiarity; but it requires a *connoisseur* to discriminate between the cognate varieties. In good years the quality is very superior. The aroma of the first growths is seldom fully developed till after they have been kept eight or nine years; but the secondary qualities come to perfection a year or two sooner. The color often grows darker as the wine advances in age, in consequence of the deposition of a portion of its tartar; but when well made, and thoroughly fined, it seldom deposits any crust. See the valuable work of Dr. HENDERSON on *Ancient and Modern Wines*; and JULLIEN, *Topographie de Vignobles*. Bordeaux wines are very rarely exported in a state of purity. We have given in the article BORDEAUX some account of the treatment to which those shipped for England are subjected, and to it we beg to refer the reader.

Champagne—so called from the province of France, of which it is the produce—is one of the most deservedly esteemed of the French wines. The wines of Champagne are divided into the two grand classes of white and red wines, and each of these, again, into still and sparkling; but there is a great variety in the flavor of the produce of different vineyards. Sillery is universally allowed to be the best of the still wines. It is dry, of a light amber color, has considerable body, and a charming aroma. "Le corps" (says M. Jullien), "le spiritueux, le charmant bouquet, et les vertus toniques dont il est pourvu, lui assurent la priorité sur tous les autres."—*Topographie de tous les Vignobles*. Dr. Henderson agrees with Jullien in considering it as one of the wholesomest of the Champagne wines. The sparkling wines are, however, the most popular, at least in England. Of these, the wine of Ay, five leagues south from Rheims, is perhaps the best. It is lighter and sweeter than Sillery, and has an exquisite flavor and aroma. That which merely creams on the surface (*demi-mousseux*) is preferred to the full frothing wine (*grand-mousseux*). Being bright, clear, and sparkling, it is as pleasing to the eye as it is grateful to the palate.

"Cernis micanti concolor ut vitro
Latex in auras, gemmeus aspic,
Scentillet exultim; utque dulces
Naribus illecebras propinet
"Succi latentis proditor halitus!
Ut spuma motu lactea turbido
Crystallinum lætis referre
Mox oculis proporet nitorem."

Hautvilliers, about four leagues from Rheims and one from Epernay, used formerly to produce wine that equaled, and sometimes surpassed, the wine of Ay. But it is no longer cultivated with the same care; so that, though still very good, it only ranks in the second

class. The best of the red wines of Champagne are those of Verzy, Verzenay, Mailly, Bouzy, and St. Basle. "Ils ont une belle couleur, du corps, du spiritueux, et surtout beaucoup de finesse, de sève, et de bouquet."—JULLIEN. The Clos St. Thierry, in the vicinity of Rheims, produces wine which, according to Jullien, unites the color and the aroma of Burgundy to the lightness of Champagne. The province of Champagne produces altogether about 1,100,000 hectolitres of wine; of which, however, the finest growths make but a small part. The principal trade in wine is carried on at Rheims, Avise, and Epernay. The vaults in which the vintages are stored are excavated in a rock of calcareous tufa to the depth of 30 or 40 feet. Those of M. Moët, at Epernay, are the most extensive, and few travelers pass through the place without going to see them. The briskest wines (*grands-mousseurs*) keep the worst.—JULLIEN.

Burgundy.—The best wines of this province, though not so popular as those of Champagne, probably because they are very apt to be injured by a sea-voyage, enjoy the highest reputation. "In richness of flavor and perfume, and all the more delicate qualities of the juice of the grape, they unquestionably rank as the first in the world; and it was not without reason that the dukes of Burgundy, in former times, were designated as the *princes des bons vins*."—HENDERSON. M. Jullien is not less decided: "Les vins des premiers crus, lorsqu'ils proviennent d'une bonne année, réunissent, dans de justes proportions, toutes les qualités qui constituent les vins parfaits; ils n'ont besoin d'aucun mélange, d'aucune préparation pour attendre leur plus haut degré de perfection. Ces opérations, que l'on

qualifie dans certains pays de *soins qui aident à la qualité*, sont toujours nuisibles aux vins de Bourgogne."

Romané-Conti, Chambertin, the Clos Vougeot, and Richebourg, are the most celebrated of the red wines of Burgundy. Chambertin was the favorite wine of Louis XIV. and of Napoleon. It is the produce of a vineyard of that name, situated seven miles south from Dijon, and furnishing each year from 180 to 150 puncheons, from an extent of about 65 acres. It has a fuller body and color, and greater durability, than the Romané, with an aroma nearly as fragrant. The white wines of Burgundy are less numerous, and, consequently, less generally known, than the others; but they maintain the highest rank among French white wines, and are not inferior to the red either in aroma or flavor. The entire annual produce of wine in Burgundy and Beaujolais may at present be estimated, at an average, at nearly 3,500,000 hectolitres, of which about 750,000 suffice for the consumption of the inhabitants. Since the revolution, the cultivation of the vine has been greatly extended in the province. Many of the new vineyards having necessarily been planted in comparatively unfavorable situations, a notion has been gaining ground that the wines of Burgundy are degenerating. This, however, is not the case. On the contrary, the quantity of *bons crus*, instead of being diminished, has increased considerably; though, as the supply of inferior wines has increased in a still greater degree, the fine wines bear a less proportion to the whole than they did previously to the revolution.—JULLIEN. The principal trade in Burgundy is carried on at Dijon, Gevrey, Châlons-sur-Saône, etc. Besides the above, France has a great variety of other excellent wines.

This makes a total export of 2,419,604 hectolitres, worth 95,403,484 francs, or £3,816,000. About ten years ago the exports did not exceed 1,500,000 hectolitres, so that there has been a large increase in the interval. And were France to adopt a liberal commercial policy, it is not easy to say to how great an extent her exports of wine, in the production of which she is immeasurably superior to every other country, might be increased. Exclusive of the above, there were exported from France in the same year 18,968 hectolitres of *vins de liqueurs*, valued at 2,001,886 francs.

The total produce of the vineyards of France is estimated at about 35,000,000 hectolitres (770,000,000 imp. gallons), worth 540,000,000 francs (£21,600,000). We beg to refer the reader to the article *BORDEAUX* for an account of the influence of the French system of commercial policy on this great department of industry. The question, whether the wines of Champagne or Burgundy were entitled to the preference, was agitated during the reign of Louis XIV. with extraordinary keenness. The celebrated Charles Coffin, rector of the University of Beauvais, published, during this controversy, the classical ode, partly quoted above, in which Champagne is eulogized, and its superiority vindicated with a spirit, vivacity, and delicacy worthy of the theme. The citizens of Rheims were not ungrateful to the poet, but liberally rewarded him with an appropriate and munificent donation of the wine he had so happily panegyrized. Gréneau wrote an ode in praise of Burgundy; but, unlike its subject, it was flat and insipid, and failed to procure any recompense to its author. The different pieces in this amusing controversy were collected and published in octavo, at Paris, in 1712.—See *LE GRAND D'AUSSEY, Vie Privée des Français*, and the *Biographie Universelle, art. COFFIN (CHARLES)*. Erasmus attributes the restoration of his health to his having drunk liberally of Burgundy; and has eulogized it in the most extravagant terms. An epistle of his, quoted by Le Grand d'Aussy, shows that Falstaff and he would have spent an evening together more agreeably than might have been supposed: "Le premier qui enseigne l'art de faire ce vin (Bourgogne), ou qui en fit présent, ne doit-il point passer plutôt pour nous avoir donné la vie que pour nous avoir gratifié d'une liqueur."—*Vie Privée des Français*.

Bordeaux Vintage of 1856.—The following table exhibits the yield of wine in the Gironde in years of full crop, compared with the actual yield of 1856, and the prices ruling at the close of the year:

Madeira—so called from the island of that name—is

a wine that has long been in high estimation in this and other countries. Plants of the vine were conveyed from Crete to Madeira in 1421, and have succeeded extremely well. There is a considerable difference in the flavor and other qualities of the wines of Madeira: the best are produced on the south side of the island. Though naturally strong, they receive an addition of brandy when racked from the vessels in which they have been fermented, and another portion is thrown in previously to their exportation. This is said to be required to sustain the wine in the high temperature to which it is subjected in its passage to and from India and China, to which large quantities of it are sent, it being found that it is mellowed and its flavor materially improved by the voyage. It does not, however, necessarily follow that the wines which have made the longest voyages are always the best. Much must obviously depend on the original quality of the wine; and many of the parcels selected to be sent to India are so inferior, that the wine, when brought to London, does not rank so high as that which has been imported direct. But when the parcel sent out has been well chosen, it is very much matured and improved by the voyage; and it not only fetches a higher price, but is in all respects superior to the direct importations. Most of the adventitious spirit is dissipated in the course of the Indian voyage.

Madeira wines may be kept for a very long period. "Like the ancient vintages of the Surrentine hills, they are truly *firmissima vina*, retaining their qualities unimpaired in both extremes of climate, suffering no decay, and constantly improving as they advance in age. Indeed, they can not be pronounced in condition until they have been kept for ten years in the wood, and afterward allowed to mellow nearly twice that time in bottle; and even then they will hardly have reached the utmost perfection of which they are susceptible. When of good quality, and matured as above described, they lose all their original harshness, and acquire that agreeable pungency, that bitter sweetishness, which was so highly prized in the choicest wines of antiquity, uniting great strength and richness of flavor with an exceedingly fragrant and diffusible aroma. The nutty taste, which is often very marked, is not communicated, as some have imagined, by means of bitter almonds, but is inherent in the wine."—HENDERSON.

The wines of Madeira have latterly fallen into disrepute in England. The growth of the island, when greatest, was very limited—not exceeding 20,000 pipes, of which a considerable quantity went to the West Indies and America. Hence, when Madeira was a fashionable wine in England, every sort of deception was practiced with respect to it, and large quantities of spurious trash were disposed of for the genuine vintage of the island. This naturally brought the wine into discredit, so that sherry has been for several years the fashionable white wine. It is difficult, however, to imagine that adulteration was ever practiced to a greater extent upon Madeira than it is now practiced upon sherry. It is not, therefore, improbable that a reaction may take place in favor of Madeira. The quantity entered for home consumption in England in 1827 amounted to 308,295 gallons, whereas the quantity entered for home consumption in 1852 amounted to only 69,730 gallons.

Malmsey, a very rich, luscious species of Madeira, is made from grapes grown on rocky grounds exposed to the full influence of the sun's rays, and allowed to remain on the vine till they are over-ripe. The trade in Madeira wine is carried on at Funchal, the capital of the island, in lat. 32° 37' N., long. 17° 6' W. Weights and measures same as at Lisbon. Madeira is said to have suffered very severely from the disease that has recently attacked the vine.

Teneriffe wine—so called from the island of that name—resembles Madeira, and is not unfrequently substituted in its stead; but it wants the full body and rich flavor of the best growths of Madeira.

German Wines.—The wines of Germany imported into England are principally produced on the banks of the Rhine and Moselle. The Rhine wines constitute a distinct order by themselves. They are drier than the French white wines, and are characterized by a delicate flavor and aroma, called in the country *gäre*, which is quite peculiar to them, and of which it would, therefore, be in vain to attempt the description. A notion prevails that they are naturally acid, and the inferior kinds, no doubt, are so; but this is not the constant character of the Rhine wines, which in good years have no perceptible acidity to the taste, at least not more than is common to them with the growths of warmer regions. Their chief distinction is their extreme durability. The wines made in warm, dry years are always in great demand, and fetch very high prices. The Johannisberger stands at the head of the Rhine wines. It has a very choice flavor and perfume, and is characterized by an almost total want of acidity. The vineyard is the property of Prince Metternich. The Steinberger ranks next to the Johannisberger. It is the strongest of all the Rhenish wines, and in favorable years has much flavor and delicacy. The produce of certain vineyards on the banks of the Moselle is of superior quality. The better sorts are clear and dry, with a light, pleasant flavor and high aroma; but they sometimes contract a slaty taste from the strata on which they grow. They arrive at maturity in five or six years; though, when made in a favorable season, they will keep twice that time without experiencing any deterioration.—HENDERSON on Wines.

Tokay—so called from a town in Hungary, near which it is produced, on the Theiss, 44 miles north-northwest from Debreczin. It is the finest of all the liqueur wines. It consists of three varieties, viz.: the *Essence*, flowing spontaneously from the ripest grapes, and corresponding with the *Mustum sponte defluens antequam calcantur uva* of the ancients; the *Ausbruch*, obtained by pressing the grapes with the hand, a small quantity of good new wine, or must, being at the same time poured over them; and the *Maslas*, or inferior variety, produced by pouring a larger quantity of less choice must over the same berries, and subjecting them to the action of the press. Of these varieties, the first, which is made only in very small quantities, is in the highest degree sweet and luscious, and is more sought for as a rarity than as being pleasant to the palate. It is on the *Ausbruch* that the reputation of Tokay depends. Mr. Paget says, "It is sweet, rich, but not cloying; strong, full-bodied, but mild, bright, and clear; and has a peculiar flavor of most exquisite delicacy. I never tasted it in perfection but at private tables, and that only twice; I could then have willingly confessed it the finest wine in the world." The *Maslas*, or inferior variety, is a much thinner wine, rather sweet, with a preponderating flavor of the dried grape. Mr. Paget estimates the entire produce of the Tokay vineyards in ordinary years at about 250,000 eimers, of about sixteen bottles each. The best *Ausbruch* is very dear, and but little that is genuine is seen in England.—PAGET'S *Travels in Hungary*, i. 481; HENDERSON, p. 228; JULIEN, p. 446.

Italian Wines.—The Sicilian white wine called *Marsala*, from the town (the ancient *Lilybæum*) whence it is shipped, and near which it is made, is now pretty largely consumed in England; the entries for home consumption having increased from 79,686 gallons in 1823 to 387,750 in 1852; an extraordinary increase, particularly when it is considered that during the same period, the consumption of most sorts of wine has been nearly stationary. Latterly, however, it has been rather declining. *Marsala* is a dry wine, the best qualities closely resembling the lighter sorts of *Madeira*; but the increased demand for it seems to have been owing as much to its cheapness as to any peculiarity of quality. It is, however, when good, an agreeable dinner wine. *Marsala* has been brought to its

present state of perfection and repute by the care and exertions of two Englishmen, the Messrs. Woodhouse, established in Sicily, who have an extensive factory in the neighborhood of *Marsala*. The wine is shipped in large quantities for America, whence a considerable quantity is again conveyed to the West Indies, where it is not unfrequently disposed of as real *Madeira*. With the exception of *Marsala*, very little wine either of Sicily or Italy is imported into England. The wines of those countries are, indeed, without perhaps a single exception, very inferior to those of France. The natives bestow no care upon the culture of the vine, and their ignorance, obstinacy, and want of skill in the preparation of wine, are said to be almost incredible. In some districts, as in Tuscany and parts of Naples, the art is, no doubt, better understood and practiced than in others; the *Montepulciano* of the former, said, by Redi (*Bacco in Toscana*), to be *d'ogni vino il re*, and the *Lacrima Christi* of the latter, being the most celebrated varieties. But the *lacrima* is better known by name than in reality, it being made in small quantities, and mostly reserved for the royal cellars.—HENDERSON. And, despite the superior quality of those now mentioned, had not the *Falerian*, *Cecuban*, and other famous ancient wines, been incomparably better than the best of those that are at present produced, they never would have elicited the glowing panegyrics of Horace.—McCULLOCH'S *Com. Dict.*

Few things are more striking to a visitor in Italy from the north of Europe than the straight rows of trees of all kinds that run through the corn-fields, at the foot of which vines are planted, and trained so as to extend in elegant festoons from one tree to another, exhibiting the pendent clusters of grapes. If the same mode of training the vines were attempted in the somewhat colder climates of France and Germany, the shade of the trees would prevent the grapes from ripening. This effect is not produced in Lombardy, where the berries become ripe, and, when eaten, are of good flavor; but the wine produced from them is, in general, of a bad or very indifferent quality. Though much of the wine is produced from such vines in the corn-fields as are distinguished by the names of *Campi Arativi Vitati*, or of *Campi Arborati Vitati*, and from vines planted in rows at such a distance from each other as to admit of maize being grown between them, and called *Ronchi*; yet in some parts are vineyards properly so called, because, like those of France and Germany, they alone occupy the ground, and are, like them, supported by props. The best wine is produced from the *Ronchi*, and more especially from the vineyards properly so called, in which, however, each vine produces less in quantity than those trained from tree to tree. The amount of produce varies greatly according to different years, different districts, and different modes of cultivation. From an approximate estimation made on many farms of various soils, it would appear that in the most productive districts the average produce of large vines trained to the trees around the corn-fields is from 48 to 52 gallons for 100 vines; and the average produce of vineyards, properly so called, from 58 to 65 gallons of wine to the acre.

In Lombardy the wine is generally of a bad quality. Its production is left chiefly to that description of cultivators before noticed under the name of colonists, who exercise little discretion and little care, either in the choice of the kind of grapes they plant or in the management of the juice. Their chief care is to obtain the largest quantity, without much regard to the flavor or the aptitude of keeping; and commonly, as soon as it is made, they divide it in equal shares with their landlords. One cause to which the inferiority of the wine is attributed arises from the general predilection in favor of red wine, or, as it is called, *Vino Nero*, which is prized according to the darkness of its color. In order to produce this deep color, the skins of the grapes are left, in the first part of the process,

to ferment with the juice. Sometimes this is suffered to continue during eight or ten days in a vat before the liquor is drawn off, and sometimes still longer, as the longer it continues the darker the wine becomes. The best wines are produced in the district near Varese, on the sunny slopes of the hills round the lakes of Como and Garda, and in the Val Calleppio, in the province of Bergamo. The wines of the localities of Sassella and Inferno, in the Valtelline, maintain the ancient renown of the Rhatian wines, relished by Augustus and celebrated by Virgil.

The wine of the Venetian provinces is, upon the whole, of a much better quality; its superiority is owing to the nature of the soil, to a better choice of the kinds of grapes that are planted, and to the more careful preparation of their juice. The best qualities are produced in the province of Treviso, in the Bericel and Euganean Hills, between Vicenza and Padua, in some districts of the province of Udine, and, above all, in the province of Verona, well known for its *Valpolicella*, the best common wine in the kingdom.

There is no old wine in the country, except in small quantities, and in the hands of a few amateur proprietors. The wine of each vintage is sold in the course of the following year; and when any of it is kept, even though it should not have become, or shown a tendency to become, vinegar, it will sell at a lower price than new wine, because it is milder, and less agreeable to the taste of the consumer.—E. B.

Previous to 1851, the annual quantity of wine produced in the kingdom, in average years, was 85,837,705 gallons, of which 52,823,203 gallons were produced in the Venetian, and 33,014,502 in the Lombard provinces. The produce of Lombardy not being sufficient for the consumption of its population, nearly 4,402,000 gallons a year more were imported either from the Venetian provinces, which produced much more than was required for their own consumption, or from the neighboring states of Modena, Piedmont, and the Papal territory, according to the respective local produce and prices. But since 1851, when the *oidium* attacked all the vines of the country, the produce has so fearfully diminished, that in 1856 the government found it necessary to grant a reduction of the direct land-tax on lands chiefly cultivated with vines, in proportion to the ascertained amount of loss. The whole produce of Lombardy in 1852 was reduced to 11,004,834 gallons, and that of the Venetian provinces, in 1854, to 7,538,311 gallons of wine. The respective loss of each province was as follows:

GOVERNMENT OF MILAN.

Wines of Greece and Cyprus.—The soil in most parts of Greece and of the Grecian islands is admirably fitted for the growth of the vine; and in antiquity they produced some of the choicest wines. But the rapacity of the Turks, and the insecurity of person and property that has always prevailed under their miserable gov-

ernment, has effectually prevented the careful cultivation of the vine, and has occasioned in many places its total abandonment. It may, however, be fairly presumed, now that Greece has emancipated herself from the iron yoke of her oppressors, that the culture of the vine will attract some portion of that attention to which it is justly entitled, and that at no distant period wine will form an important article of export from Greece. Nowhere, perhaps, has the destructive influence of Turkish barbarism and misgovernment been so apparent as in Candia and Cyprus. While these two renowned and noble islands were possessed by the Venetians they supplied all Europe with the choicest dessert wines. Bacci affirms that, toward the end of the 16th century, Candia sent annually 200,000 casks of malmsey to the Adriatic, whereas at present it hardly produces sufficient to supply the wants of its few impoverished inhabitants.—HENDERSON. The wines of Cyprus, particularly those produced from the vineyard called the Commandery, from its having belonged to the Knights of Malta, were still more highly esteemed than those of Crete. In the earlier part of last century the total produce of the vintage of the island was supposed to amount to above 2,000,000 gallons, of which nearly one half was exported; but now the wine grown and exported does not amount to one-tenth part of these quantities! The oppression of which they have been the victims has reduced the peasantry to the extreme of indigence. The present population of the island is not supposed to exceed 60,000—a number insufficient to have peopled one of its many ancient cities; and small as this number is, it is constantly diminishing by the inhabitants availing themselves of every opportunity of emigrating.

Cape Wines.—The famous Constantia wine is the produce of two contiguous farms of that name at the base of Table Mountain, between eight and nine miles from Cape Town. The wine is very rich and luscious, though, according to Henderson, it yields in point of flavor and aroma to the muscadine wines of Languedoc and Roussillon. But, with this exception, most part of the Cape wines brought to England have an earthy, disagreeable taste, are often acid, want flavor and aroma, and are, in fact, altogether execrable.

American Wine.—The extent of our territory over which the wine culture may be advantageously diffused has long afforded a subject of much speculation. It early attracted the attention of the first colonists, who not only attempted to form vineyards of the European vine, but to make wine from our own native grapes. Although the subject has been zealously and sedulously pursued at various periods since, all those dwelling on the easterly half of the continent who have made trial of the foreign grape have never been able to bring their designs to perfection; and those who have tested their skill in our native varieties have only met with partial success; yet a degree of perseverance and enthusiasm seems to have pervaded all the votaries of this delightful pursuit, and a warm and mutual interchange of views and sentiments has existed among them, which has been comparatively unknown in other species of culture. Although the operators in recent times, from being interspersed over so great an extent of territory, are consequently more widely separated, still the connecting link, by a friendly co-operation in one common cause, may justly and appropriately assimilate their united exertions to that joyous period in the history of France when, during the reign of Probus, thousands of all ages and sexes united in one spontaneous and enthusiastic effort for the restoration of their vineyards. Indeed, when the far greater limits of our domain are considered, the combined efforts of our fellow-countrymen can not fail to produce effects even more important, from the great extent of their influence, and cause each section of our republic reciprocally to respond to the efforts of others, with all their attendant advantages and blessings.

The earliest attempt to establish a vineyard in the British North American colonies was by the "London Company" in Virginia, prior to 1620. By the year 1630 the prospects were sufficiently favorable to warrant the importation of several French *vignerons*, who, it was alleged, ruined them by bad management. Wine was also made in Virginia in 1647, and in 1651 premiums were offered for its production. On the authority of Beverley, who wrote prior to 1722, there were vineyards in that colony which produced 750 gallons a year. Beauchamp Plantagenet, in his "Description of the Province of New Albion," published in London in 1648, states that the English settlers in Uvedale (now Delaware) had vines running on mulberry and sassafras trees, and that there were four kinds of grapes. "The first," says he, "is the Thoulouse Muscat, sweet scented; the second, the great foxe and thick grape, after five moneths reaped, being boyled and salted, and well fined, it is a strong red Xeres; the third, a light claret; the fourth, a white grape, creeps on the land, maketh a pure gold-color wine: Tennis Pale, the Frenchman, of these four made eight sorts of excellent wine; and of the Muscat, acute boyled, that the second draught will fox [intoxicate] a reasonable pate, four moneths old; and here may be gathered and made two hundred tun in the vintage moneth, and replanted, will mend." An attempt to establish a vineyard near Philadelphia was made by William Penn in 1683; also by Andrew Dore in 1685; but neither succeeded.

In 1769 the French settlers on Illinois River made upward of 100 hogsheds of strong wine from the American wild grape.

The quantity of wine annually produced in the United States has become a subject of some discussion since the appearance of the return in the Seventh Census on that interest. The census of 1840 gave 124,000 gallons as the produce of that year. It has been stated in the public prints that since that period the culture of the grape, and the manufacture of wine therefrom, have grown into a business of considerable importance in the States bordering on the Ohio River, and that several hundred acres have been planted in vineyards in that valley, which yield at the rate of more than 45,000 gallons of wine a year. The total product of the Union in 1850 was given at 221,249 gallons. But during the intervening period there had been added to our own territory California and New Mexico, which in the latter year produced 60,718 gallons. This quantity deducted from the aggregate, leaves 160,531 gallons for the portion of the Union covered by the returns of 1840—indicating a gain of only 36,000 gallons. This is probably an understatement, but it seems to prove that no considerable progress has yet been made toward supplying by a home production the demand, to meet which importations of foreign wines to a very large amount are annually made. The consumption of wine in the United States, though by no means general, amounts in the aggregate to a large sum. The imports during the year ending June, 1851, were 6,160,000 gallons, of which probably three-fourths consisted of the wines of France. The value or invoice cost of the article was \$2,370,000. The average consumption of foreign wines was, therefore, in quantity but about one quarter of a gallon for each person, and in value only ten cents. The coincidence is somewhat remarkable, that this is almost precisely the rate of consumption of imported wine among the people of Great Britain. But in France, according to official returns, there is produced and retained for consumption 900,000,000 gallons of wine, allowing 25½ gallons to each person in the population.

It appears, from other tables in our census returns, that the quantity of ale and spirituous liquors produced in the United States in 1850 exceeded 86,000,000 gallons. The amount exported was balanced by the imports, and the quantity rejected, in forming the above estimate, for the sake of preserving round numbers;

the consumption of malt and spirituous liquors for manufacturing purposes, and as a beverage, appears to have been at the rate of nearly four gallons per head. It is the opinion of many, whose inquiries upon the subject entitle them to respect, that among what are called "civilized" nations, the vice of inebriation has always been found to prevail most extensively where the vine is not cultivated; while, on the other hand, where this species of culture is widely disseminated, the temperance of the people is proverbial. If such be the case, we may proudly hope that the day is not far distant when America will fully establish and claim a rivalry with the most favored land of the vine and the olive, and exultingly disclaim being tributary to any foreign clime.—*Patent Office Report.*

Concerning the wine culture in this country, which is yet in its infancy, we find in a recent German publication some interesting facts from the pen of Dr. Gumprecht. The author explains the causes of the failure of the manifold attempts to domesticate the European grapes in the United States by comparative thermometrical and hygrometrical statements, from which it appears that the ill success is attributable to the greater proportion of moisture to which the vine is subjected here, while the temperature is more favorable in Philadelphia, Cincinnati, or St. Louis than in Paris, Dresden, or Prague. The Catawba grape, an indigenous variety, is now extensively cultivated in the West and Southwest, and the Catawba wine bids fair to become an important article of commerce. In 1854 the vineyards comprised less than three thousand acres, the greater proportion of which was in the vicinity of Cincinnati, whence the grape culture has since spread, along both banks of the Ohio, to Pittsburgh and Cairo, and in a southerly direction through Kentucky and Tennessee to Alabama, and westwardly into Missouri.

On the Ohio an acre yields on an average 500 gallons of wine—an immense yield compared with the average of France, which is only 200 gallons. In 1853, however, which was the most fruitful year since 1848, the yield was most extraordinary, averaging along the Ohio 650 gallons to the acre, some vineyards producing from 800 to 900 gallons. The wine-growers of Ohio are mainly Germans and their descendants.

In 1852, notwithstanding the comparatively small area devoted to wine growing, the produce of wine in the United States was estimated at 500,000 gallons; and in 1854 the mammoth cellar of Messrs. Longworth and Zimmerman, at Cincinnati, contained 80,000 gallons. In a few years the product will doubtless be doubled and trebled, since the present high prices of wine pay the producer a fair profit, and the demand is so great that the Cincinnati wine-dealers are scarcely able to keep a stock on hand.

The juice of the grape is manufactured either into still wine or sparkling wine. The latter, in the preparation of which, as in that of Champagne, liquor is added, is the most sought after, and its production has already increased to such an extent that Buchanan estimated the value of sparkling wines raised in Ohio at \$175,000 per annum.

The wine produced in the United States is mostly of the description known as the white wine, but little of it being red. The value of the wine depends, as in Europe, on the character of the soil, the mode of treatment, and the weather. The years 1846, 1848, and 1851 produced the best wines, both here and in Europe; the vintage of 1853 was also a good one. In general, the product of the Catawba grape has the finest flavor and the greatest durability; it improves in quality for thirty years. According to an analysis made in 1848, the American wines contain from 7 to 11 per cent. of alcohol. A sample of Catawba hock from Longman's cellar, seven years of age, was proved by an analysis to contain from 11 to 11½ per cent. of alcohol; and a sample of red wine, of the Cape spe-

cies, was found to contain 9½ per cent. Buchanan states that the proportion of alcohol in the American wines is about the same as in the wines of France and Germany. Brände, however, contends that the French Graves wine contains 13-94, Barsac 13-86, Sauterne 14-22, Rudesheimer of 1800 12-22, and Hock 14-37 per cent. of alcohol.

The prices of American wines may be considered high. Ten to twelve bottles of stored still wine cost from \$5 to \$8, and sparkling wine brought \$12 in 1854. New wine ranges from 40 cents to \$1 10.

Of the recent territorial acquisitions of the United States, California, and Florida will probably ere long be ranked among the wine-producing States. In California the efforts of the old Catholic missionaries to cultivate the grape resulted satisfactorily, and the manufacture of wine from the domestic grape of Florida was also attended with success. Sir John Hawkins reports that in 1694 the settlers in Florida realized twenty hogsheads of palatable wine from the native grape. The good results which were anticipated from this discovery were, thanks to the political disturbances in which that colony became involved, never realized.

In Canada West, where certain species of wild grapes are very abundant, the manufacture of wine, recently introduced, has been attended with the most signal success. Buchanan's Journal pronounces it superior to the imported port-wine.—*N. Y. Eve. Post.*

The following statement shows the production of wine in the several States of the Union in the years 1840 and 1850, according to the census returns:

There were no exports of wine of domestic production from the United States for the fiscal year 1856-'57.

The exports of foreign wine from the United States for the year ending June 30, 1857, were as follows:

	Value.
Madeira.....	\$6,101
Sherry and St. Lucar.....	11,993
Port.....	14,081
Claret.....	27,691
Sicily.....	9,816
Red wine unenumerated.....	54,848
White wine unenumerated.....	3,646
Champagne.....	22,140

Wings. In naval matters, passages along the sides of the ship between the fore and after cockpit.

Wire. The invention of drawing wire is ascribed to Rodolph of Nuremberg, A.D. 1410. Mills for this purpose were first set up at Nuremberg in 1563. The first wire-mill in England was erected at Mortlake, in 1663.—MORTIMER. The astonishing ductility, which is one of the distinguishing qualities of gold, is no way more conspicuous than in gilt wire. A cylinder of 48 ounces of silver, covered with a coat of gold weighing only one ounce, is usually drawn into a wire two yards

of which only weigh one grain; so that 98 yards of the wire weigh no more than 49 grains, and one single grain of gold covers the whole 98 yards; and the thousandth part of a grain is above one-eighth of an inch long.—HALLEY. Eight grains of gold covering a cylinder of silver are commonly drawn into a wire 13,000 feet long; yet so perfectly does it cover the silver, that even a microscope does not discover any appearance of the silver underneath.—BOYLE.

Wisconsin, one of the northwestern United States, lies between lat. 42° 30' and 49° 30' N., and between long. 86° 50' and 96° W., being 600 miles long and 150 broad. It contains about 53,924 square miles. Population in 1840, 30,945; in 1845, 150,000; and in 1850, 305,191.

The portion south of Green Bay, Fox and Wisconsin rivers, is composed of timbered and prairie lands, with some swamps and wet prairies, having a vegetable soil from one to two feet deep. North of the Wisconsin River commences a hilly region, swelling as it proceeds north into a mountainous country, with a rugged and broken surface, creating many rapids and falls in the streams, and affording many wild and picturesque views. The northwest part of the State is covered with immense forests of pine, and much rough land, especially bordering Lake Superior. On the ridge dividing the waters flowing north into Lake Superior, and those flowing south into the Mississippi, are many small lakes, in which fish are abundant. Bordering on the Mississippi and Wisconsin rivers the soil is rich, and the land generally heavily timbered. Wisconsin is rich in minerals; the great Mississippi lead region lies mostly within its limits; iron ore of the best quality exists bordering the sources of all the streams entering the Mississippi, and copper along the shores of Lake Superior; marble, limestone, sandstone, gypsum, and other variety of minerals abound.

There were in this State in 1850, 1,015,499 acres of land improved, and 1,931,159 of unimproved land in farms; cash value of farms, \$28,528,563; and the value of implements and machinery, \$1,641,568. *Live Stock*.—Horses, 30,179; asses and mules, 156; milch cows, 64,339; working oxen, 42,801; other cattle, 76,293; sheep, 124,896; swine, 159,276: value of live stock, \$4,897,985.

Agricultural Products.—Wheat, 4,286,131 bushels; rye, 81,233; Indian corn, 1,988,979; oats, 3,414,672; barley, 209,692; buckwheat, 79,878; peas and beans, 20,657; potatoes, 1,402,077; sweet potatoes, 879; value of products of the orchard, \$4823; produce of market gardens, \$32,142; pounds of butter made, 3,633,750; of cheese, 400,283; maple-sugar, 610,976; molasses, 9874 gallons; beeswax and honey, 131,005 lbs.; wool, 253,963; flax, 63,393; hops, 15,930; tobacco, 1263; hay, tons of, 275,662; hemp, 2; clover seeds, 483 bushels; other grass seeds, 5003; flaxseed, 1191; and were made 118 gallons of wine: value of home-made manufactures, \$43,624; of slaughtered animals, \$920,178.

The principal rivers are the Mississippi, which flows along its western border for a distance of 275 miles. The Wisconsin has its entire course within the State, flows centrally, and enters the Mississippi on its western border. It is navigable to the portage of Fox or Neenah River, where a canal is being made, which, when completed, with the contemplated improvements of Fox River, will make a navigable communication between the Mississippi and the lakes. The Chippewa enters the Mississippi farther northwest, and is a large river, and St. Croix River forms a portion of its extreme western boundary. Rock River rises and flows partly in this State. The other principal rivers are the Menominee on its eastern border, entering Green Bay, and the Montreal, entering Lake Superior; there are also other small streams entering Lake Superior. The Milwaukee, Sheboygan, as well as others, enter Lake Michigan. The other most noted streams are the Wolf, Bad Axe, and Black Rivers. The principal

lakes within its borders are Winnebago, Horicon, Kaskahong, and the four lakes in the south, and many small ones in the north. The principal places in the State are Madison, the capital, Milwaukee, Racine, Kenosha, Osaukee, Green Bay, Jamesville, and Prairie du Chien. There were in January, 1854, four railroads in the State, with 647 miles of road finished and in operation, and there were 10 banks with a cash capital of \$600,000.

Manufactures, etc.—There were in the State in 1850, 9 woolen factories, with a capital invested of \$81,225, employing 25 males, manufacturing 36,000 yards of cloth and 74,350 lbs. of yarn, valued at \$87,992; 1 establishment making pig-iron, with a capital of \$15,000, employing 60 persons, and making 1000 tons of pig-iron, valued at \$27,000; 15 establishments, with a capital of \$116,350, employing 228 persons, producing 1342 tons of castings, etc., valued at \$216,195; 75 flouring and grist mills, 412 saw-mills; 34 tanneries; 42 printing-offices, issuing 6 daily, 5 tri-weekly, 36 weekly, and 1 monthly publication.

FOREIGN COMMERCE OF THE STATE OF WISCONSIN FROM JULY 1, 1853, TO JULY 1, 1857.

Years ending	Exports.	Imports	Tonnage cleared	
	Total.	Total.	American.	Foreign.
June 30, 1854	\$30,464	\$19,174
1855	174,057	43,153	8,149	400
1856	945,493	27,614	32,912	2710
1857	522,044	5,817	46,056	2806

At the close of the year 1857, the number of banks in Wisconsin had increased to 73, with a combined capital of \$5,600,000, and bank-note circulation \$3,000,000, the latter being secured by a collateral deposit of State stocks.

Woad (Ger. *Waid*; Du. *Weede*; Fr. *Pastel*, *Guède*, *Vouède*; It. *Guadone*, *Guado*, *Glastro*; Sp. *Pastel*, *Glasto*), the *Isatis tinctoria* of botanists, a biennial plant, with a fusiform fibrous root, and smooth branchy stem, rising from three to five feet in height. Woad is indigenous to most parts of Europe; and was extensively used from a very remote period, down to the general introduction of indigo, in the dyeing of blue. It is still cultivated to a considerable extent in France; but in England its cultivation is chiefly restricted to a few districts in Lincolnshire. After being bruised by machinery, to express the watery part, it is formed into balls, which ferment and fall into a dry powder, which is sold to the dyer. Woad is now seldom employed without a mixture of indigo. By itself it is incapable of giving a bright and deep blue color; but the color which it does give is very durable. The best methods of conducting the fermentation and preparation of woad are still so very ill understood, that the goodness of any parcel of it can never be ascertained till it be actually used; so that it has the disadvantage of being purchased under the greatest uncertainty as to its true value. At the proper age, indigo plants yield about thirty times as much coloring matter, and of a far superior quality, as an equal weight of woad; so that there is no prospect that any improvement that may be made in its preparation will ever render it, either in goodness or cheapness, a rival of the former.—LOUBON'S *Encycl. of Agriculture*; BANCROFT on *Colors*.

Woods. Mr. Holtzapffel, in his elaborate work on "Turning," gives a very minute description and classification of the various kinds of wood used in the arts. He first points out the well-known structural difference between *exogens* and *endogens*, which leads to a separation of all kinds of trees into two great groups; all the true woods (as they are sometimes termed) are *exogens*; whereas the *endogens* include the grasses, bamboos, palms, etc. In the countries where bamboos and palms are indigenous, the smaller stems are used as tubes for the conveyance of water, and the larger pieces as joists, etc. In the larger kinds of palm, the fibres appear like streaks or wires imbedded in a substance similar to cement or pith.

IMPORTS OF WOOD AND MANUFACTURES OF WOOD, ETC., INTO THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1857.

Whence Imported.	Manufactures of Wood.				Unmanufactured Wood.				Corks.	Unman- ufactured Cork.

The natives of the Isthmus of Darien pick out the fibres from some of the palms, and use them as nails; in some specimens they are as hard as rose-wood. Some of the smallest palms are imported into this country for walking-sticks, under the names of partridge and Penang canes. Of the four or five hundred varieties of palm-trees known to exist, only a very small number are imported. The palm woods so imported are sparingly employed for cabinet and marquetry work, for billiard cues, for snuff-boxes, etc. The twisted palm walking-sticks are the central stems or midribs of the leaves of the date palm: they are twisted when green, and stretched with heavy weights until they are thoroughly dry. The nut, or fruit, of many of this group of plants is applicable to uses in the arts; such as the betel-nut or areca-nut, whose substance is made into necklaces, the tops of walking-sticks, and other small objects; the cocoa-nut, whose shell yields the fibre or coir, now used in England for a great variety of purposes, and the hard portion of the shell, which is turned into cups, vases, buttons, etc.; the coquilla-nut, the shell of which, being hard and close-textured, is turned into knobs of umbrellas and parasols, small toys, etc. With respect to the simple wants and primitive arts of the people among whom the palms and bamboos grow, the uses of those plants are very numerous; of the *Cocos nucifera*, or cocoa-nut palm, for example, the fruit is eaten, the husk of the nut supplies coir for cordage, the leaves are used for making baskets and mats, the lower part of the stem yields wood fitted for joists and other kinds of carpentry, and

different portions of the plant are made to yield oil, sugar, palm wine, and arrack.

But it is the exogenous or true woods which render the more important services to man, so far as regards the stem or wood itself. The fibres do not appear to differ in size or bulk so much as in density and distance; these two last-named differences give rise to the distinction between hard and soft woods—the former comprising oak, mahogany, ebony, rose-wood, etc.; and the latter willow, alder, deal, etc. Another classification is that which springs from the direction of the fibres; if the annual or longitudinal fibres be tolerably straight, and very little interwoven with the medullary rays or interrupted by knots, the wood becomes elastic and easily rent; such are lance-wood, hickory, ash, etc.; but if the fibres are more crossed and interlaced, the wood becomes less elastic, and more rigid and tough; such are oak, beech, mahogany, etc.; and if the fibres be entangled to a still greater degree, they produce the non-elastic, tough, cross-grained woods, such as elm, lignum-vite, etc. Another mode of classification, traced with some minuteness by Mr. Holtzapffel, is that which is determined by the beauty of the surface presented by woods. The knots, occasioned by the junction of a branch with the stem; the curls, produced by the confused filling in of the space between the forks or springings of the branches, as in the yew; the gnarled appearance of the roots, formed at the points of junction of the rootlets or arms of the root with the body of the root itself, as in walnut wood; the pollard growths of the oak and other trees, which

owe the beauty of their grain to a crowding together of the little germs that produce the numerous shoots at the top; the ripple-mark surface, occasioned by a serpentine form of the grain, as in satin-wood and sycamore; the bird's-eye pattern, occasioned by a peculiar compression of the grain in isolated spots, as in some kinds of maple; the silver-grain, which results from a marked distinctness in the medullary rays, as in the plane, sycamore, and beech—all give rise to variations in the appearance of the surface of wood, which are the mainspring of the beauty observable in cabinet work. Another and very obvious mode of classifying woods is in respect to their color.

Mr. Holtzapffel gives a tabular view of all the kinds of wood commonly used in this country. The list includes nearly eighty species of trees, without naming the varieties of each species. He classifies them according to the services which they are calculated to render. One group includes *building* woods, subdivided into those fitted for ship-building, for house carpentry,

and for hydraulic engineering; another group includes the woods most useful for *machinery* and *mill-work*, subdivided according as the wood is suitable for frame-work, for rollers, for teeth of wheels, or for foundry patterns; a third group comprises the *turnery* woods, subdivided into common soft woods, hard woods, and Tunbridge-ware woods; a fourth group is made up of *furniture* woods, separated into common and best; a fifth group comprises *ornamental* foreign woods; a sixth group consists of *dye-woods*, arranged according to color; while a miscellaneous group is formed, subdivided according to the elasticity, the toughness, the even grain, or the durability of the wood. Of course many kinds of wood find a place in two or more of these groups; but the table is valuable, inasmuch as it brings together before the eye the names of all those woods which resemble each other in some one manufacturing quality.

The following tables show the exports (distinguishing between domestic and foreign production) of wood and its manufactures for the year ending June 30, 1857:

Wool (Ger. *Wolle*; Du. *Wol*; Da. *Uld*; Swed. *Ull*; Fr. *Laine*; It. and Sp. *Lana*; Port. *Lã*, *Lãa*; Russ. *Wolna*, *Scherst*; Pol. *Welna*; Lat. *Lana*), a kind of soft hair or down. The term is not very well defined. It is applied both to the fine hair of animals, as sheep, rabbits, some species of goats, the vicuña, etc.; and to fine vegetable fibres, as cotton. In this article, however, we refer only to the wool of sheep—an article which has continued, from the earliest period down to the present day, to be of primary importance, having always formed the principal part of the clothing of mankind in most temperate regions.

Species of Wool.—It has been customary to divide wool into two great classes—long and short wools; and these again into subordinate classes, according to the fineness of the fibre. Short wool is used in the cloth manufacture; and is, therefore, frequently called clothing wool. It may vary in length from one to three or four inches; if it be longer, it requires to be cut or broken to prepare it for the manufacture. The *felting* property of wool is known to every one. The process of hat-making, for example, depends entirely upon it. The wool of which hats are made is neither spun nor woven; but locks of it, being thoroughly intermixed and compressed in warm water, cohere and form a solid, tenacious substance.

Cloth and woollen goods are made from wool possessing this property; the wool is carded, spun, woven, and then, being put in the fulling-mill, the process of felting takes place. The strokes of the mill make the fibres cohere; the piece subjected to the operation contracts in length and breadth, and its texture becomes more compact and uniform. This process is essential to the beauty and strength of woollen cloth. But the long wool of which stuffs and worsteds are made is deprived of its felting properties. This is done by pass-

ing the wool through heated iron combs, which takes away the laminae or feathery part of the wool, and approximates it to the nature of silk or cotton. Long or combing wool may vary in length from three to eight inches. The shorter combing wools are principally used for hose, and are spun softer than the long combing wools; the former being made into what is called hard, and the latter into soft worsted yarn. The fineness of the hair or fibre can rarely be estimated, at least for any useful purpose, except by the wool sorter or dealer, accustomed by long habit to discern those minute differences that are quite inappreciable by common observers. In sorting wools, there are frequently eight or ten different species in a single fleece; and if the best wool of one fleece be not equal to the finest sort, it is thrown to a 2d, 3d, or 4th, or to a still lower sort, of an equal degree of fineness with it. The best English short native fleeces, such as the fine Norfolk and Southdown, are generally divided by the wool-sorter into the following sorts, all varying in fineness from each other: viz. 1. Prime; 2. Choice; 3. Super; 4. Head; 5. Downrights; 6. Seconds; 7. Fine Abb; 8. Course Abb; 9. Livery; 10. Short, coarse, or breech wool. The relative value of each varies, according to the greater demand for coarse, fine, or middle cloths.

The softness of the fibre is a quality of great importance. It is not dependent on the fineness of the fibre; and consists of a peculiar feel, approaching to that of silk or down. The difference in the value of two pieces of cloth made of two kinds of wool equally fine, but one distinguished for its softness and the other for the opposite quality, is such, that, with the same process and expense of manufacture, the one will be worth from 20 to 25 per cent. more than the other. Mr. Bakewell showed that the degree of softness depends principally on the nature of the soil on which sheep

are fed; that sheep pastured on chalk districts, or light calcareous soils, usually produce hard wool; while the wool of those that are pastured on rich, loamy, argillaceous soils, is always distinguished by its softness. Of the foreign wools, the Saxon is generally softer than the Spanish. Hard wools are all defective in their *felting* properties. In clothing wool, the color of the fleece should always approach as much as possible to the purest white; because such wool is not only necessary for cloths dressed white, but for all cloths that are to be dyed bright colors, for which a clear white ground is required to give a due degree of richness and lustre. Some of the English fine-wooled sheep, as the Norfolk and Southdown, have black or gray faces and legs. In all such sheep there is a tendency to grow gray wool on some part of the body, or to produce some gray fibres intermixed with the fleece, which renders the wool unfit for many kinds of white goods; for though the black hairs may be too few and minute to be detected by the wool sorter, yet when the cloth is stoved they become visible, forming reddish spots, by which its color is much injured. The Herefordshire sheep, which have white faces, are entirely free from this defect, and yield a fleece without any admixture of gray hairs.

The cleanness of the wool is an important consideration. The Spanish wool, for example, is always scoured after it is shorn; whereas the English wool is only imperfectly washed on the sheep previously to its being shorn. In consequence, it is said that while a pack of English clothing wool of 240 lbs. weight will waste about 70 lbs. in the manufacture, the same quantity of Spanish will not waste more than 48 lbs. Cleanness, therefore, is an object of much importance to the buyer. Before the recent improvements in the spinning of wool by machinery, great length and strength of staple was considered indispensable in most combing wools. The fleeces of the long-wooled sheep fed in the rich marshes of Kent and Lincoln used to be reckoned peculiarly suitable for the purposes of the wool-comber; but the improvements alluded to have effected a very great change in this respect, and have enabled the manufacturer to substitute short wool of three inches staple in the place of long combing wool, in the preparation of most worsted articles. A great alteration has, in consequence, taken place in the proportion of long to short wool since 1800; there having been in the interim, according to Mr. Hubbard's calculations, an increase of 132,053 packs in the quantity of the former produced in England, and a decrease of 72,820 in the quantity of the latter.

Whiteness of fleece is of less importance in the long combing than in clothing wool, provided it be free from gray hairs. Sometimes, however, the fleece has a dingy brown color, called a *winter stain*, which is a sure indication that the wool is not in a thoroughly sound state. Such fleeces are carefully thrown out by the wool sorter, being suitable only for goods that are to be dyed black. The fineness of heavy combing wool is not of so much consequence as its other qualities. The Merino or Spanish breed of sheep was introduced into England about the close of last century. George III. was a great patron of this breed, which was for several years a very great favorite. But it has been ascertained that, though the fleece does not much degenerate, the carcass, which is naturally ill-formed, and affords comparatively little weight of meat, does not improve; and as the farmer, in the kind of sheep which he keeps, must look not only to the produce of wool, but also to the butcher market, his interest is rather to return to the native breeds, and to give up the Spanish sheep. They have, however, been of considerable service to the flocks of England; having been judiciously crossed with the Southdown, Ryeland, &c.

Dr. Anderson, in a memorial submitted to the "Report of the Committee of the Highland Society," proves, from indisputable records, that from the earliest times

down to the reign of Queen Elizabeth, the wool of Great Britain was not only superior to that of Spain, but accounted the finest in the universe; and that even in the times of the Romans a manufacture of woollen cloths was established at Winchester for the use of the emperors. In later times, wool was manufactured in England, and is mentioned in A.D. 1185, but not in any quantity until 1831, when the weaving of it was introduced by John Kempe and other artisans from Flanders. This was the real origin of the English wool manufactures, Edward III., 1331.—*KYMER'S Fæderia*. The exportation prohibited, 1837. The exportation of English wool, and the importation of Irish wool into England prohibited, 1696. The non-exportation law repealed, 1824.—HAYDN.

Alpaca Wool.—The alpaca is one among many species of the llama, the wool of which is very beautiful. The first visit of these animals to Europe was an adventurous one. Thirty-six traveled across the whole breadth of South America, from Lima to Buenos Ayres, in 1808, and were there shipped to Europe as a present to the Empress Josephine. At Cadiz the poor animals were ill-treated by a rabble, and only a small number were ultimately preserved in Spain; they never reached Josephine. By degrees it was found that alpaca wool was longer, softer, more pliant, and more lustrous than sheep's wool, and the manufacturers of Bradford began to import it for use. Queen Victoria possesses one or two of these animals at Windsor, and some articles of dress were made from the alpaca wool in 1844: one was an apron, entirely of alpaca; another was a striped and figured dress, with silk warp, alpaca weft, and alternate silk and alpaca figures; a third was a plaid dress, woven with an intermixture of alpaca, silk, and worsted; while a fourth was a plain black dress, with cotton warp and alpaca weft. Many attempts have been made to establish the breed of the alpaca in England, but hitherto the enterprise has not been commercially successful.

That alpaca wool is coming extensively into use in England is shown by the imports: in 1836 to 1840 they averaged 7000 bales per annum; in 1841 to 1845, the average was 13,000 bales; in 1846 to 1850, more than 20,000.—*See ALPACA*.

Cashmere Wool.—It is an interesting feature in the modern history of the woollen manufacture, that the wool, or rather hair, of the Cashmere goat is becoming a favorite material in cloth of the better kind. Not that all the "Cashmeres" of the shops are really Cashmeres; the *morale* of trade has not yet reached the point when things are called by their right names; and the beautiful Asiatic valley is quite innocent of the greater part of those products which rejoice in the name of "Cashmeres." Still the high-born and the wealthy occasionally purchase shawls which were really made in that region, and (what is more interesting to us) attempts are being made to naturalize the animal which produces the beautiful filamentous material in question. The fleece of the Cashmere goat consists of two very different kinds of fibre—one of which is a fine, soft, pliable, rich wool, equal to the finest lamb's wool; while the other, called *kemp*, is a hard, stiff, coarse, rough kind of hair. The kemp may be used in the manufacture of coarse cloth; but every fibre must be removed before the fine wool can be employed in shawl-making. This removal is very difficult and tedious, and will be a bar to the spread of the manufacture, unless some expeditious system to effect it can be devised. Prince Albert has some Cashmere goats at Windsor; and some few months before the Great Exhibition was opened he caused the fleeces of those goats to be forwarded to two manufacturing firms, one near Leeds, and one near Halifax, there to be subjected to manufacturing processes. The separation of the fine wool from the kemp was a slow manipulative process, which many persons undertook voluntarily and pleasurably. Of course the expense which would attend

such a mode of manufacture for ordinary sale would be quite disproportionate to the result obtained; but the prince's praiseworthy object was answered by showing that the Cashmere goat *can* be reared, and that the fleecy covering can be wrought into cloth. The articles produced from the wool in question consisted of a piece of white cloth, with silk warp and Cashmere weft, woven with a brocaded figure; a piece of similar character, but dyed; two shawls made wholly of the Cashmere wool; and a piece of coarse woollen cloth made from the kemp or hair.—See CASHMERE.

Mauchamp Merino Wool.—In 1828 M. Graux, a farmer at Mauchamp, in the French department of Aisne, had a lamb which, as it grew up, became remarkable for the long, smooth, straight, and silky character of the fibres of the wool. He resolved to insure, so far as he could, a perpetuation of these valuable qualities in the progeny of the lamb. In 1830 he had one ram and one ewe whose wool was of this peculiar kind; in 1831 he had four rams and one ewe of the desired kind; and by 1833 the number was much increased. Thenceforward the progeny was very remarkable; some of the lambs, like their mothers, had the curled elastic wool of ordinary merino sheep; while the others, like their sires, had the long silky wool. As years advanced, M. Graux was able to obtain a breed of sheep which combined in the wool nearly all the qualities of the two former kinds; and thus originated the Mauchamp wool, which now sells in France for 25 per cent. above the best merino. It is found to be nearly equal to the real Cashmere wool in flexible delicacy of fibre, as a material for Cashmere shawls; and when combined with the real Cashmere, it imparts a strength in which that wool is deficient.

Deterioration or Change in the Character of British Wool.—It appears to be sufficiently established, by the evidence taken before the House of Lords in 1828, and other authorities, that a considerable deterioration, or rather, perhaps, change, has taken place in the quality of British wool, particularly during the 30 preceding years. The great object of the agriculturist has been to increase the weight of the carcass and the quantity of the wool; and it seems very difficult, if not quite impossible, to accomplish this without injuring the fineness of the fleece. Mr. Culley says, that the Herefordshire sheep, that produce the finest wool, are kept lean, and yield $1\frac{1}{2}$ lb. each; he adds, "if they be better kept, they grow large and produce more wool, but of an inferior quality." This would seem to be universally true. The great extension of the turnip husbandry, and the general introduction of a larger breed of sheep, appears, in every instance, to have lessened the value of the fleece. Speaking of the Norfolk fleeces, Mr. Fison, a wool sorter, says that 25 years ago the weight was $2\frac{1}{2}$ lbs. a fleece, and that now it is 3 lbs. or $3\frac{1}{2}$ lbs. But according to a table furnished by the same gentleman, containing the results of his experience, it appears that of 15 tods, or 420 lbs., of clothing wool grown in Norfolk in 1790, 200 lbs. were *prime*, while in 1828 the same quantity of Norfolk wool only yielded 14 lbs. *prime*. The statements of other witnesses are to the same effect. According to the estimate in Mr. Luccock's *Treatise on English Wool*, which has always enjoyed the highest reputation, the produce of all sorts of wool in England in 1800 was 384,000 packs, of 240 lbs. a pack. But Mr. Hubbard, a very intelligent and extensive wool-stapler at Leeds has shown that, supposing Mr. Luccock's estimate of the number of sheep to be correct, the quantity of wool produced in 1828 could not, owing to the greater weight of the fleece, be estimated at less than 463,169 packs; and it is now (1814) believed to amount to fully 500,000 packs. It is, therefore, probable, notwithstanding the decline in the price of wool, that, taking into account the greater weight of the carcass, and the greater weight of the fleece, sheep produce more at present to the farmer than at any former period.

We give below a statement of the quantity of the wool imported into Great Britain in fifteen years, from 1840 to 1854, inclusive.

Years.	Germany.	Australia.	Total.
	Pounds.	Pounds.	Pounds.
1840	21,812,664	9,755,248	49,446,284

Of late years Russia has become of primary importance among the wool exporting countries, especially from her ports on the Black Sea. Provided tranquillity could be maintained in South Africa, the probability is that it would in no very lengthened period rival New South Wales as a wool exporting country. Alpaca, and other wools of that sort, come from Peru; goats' wool comes principally from Turkey, but the best is that of Thibet.

United States.—Analogous in the uses for which it serves to cotton, wool is a product of only less importance to the prosperity of the country than that leading staple of our agriculture and commerce. It is a very gratifying fact that though the number of sheep has

increased in ten years but 12 per cent., the aggregate weight of their fleeces has augmented 46 per cent. In 1840 there were 19,311,374 sheep, yielding 35,802,114 lbs. of wool, equal to 1·84 lb. per head. In 1850 the average weight of each fleece was 2·43 lbs., from which it would appear that such an improvement had taken place in the various breeds of the American sheep as to increase their average product about 32 per cent. throughout the United States. And a critical analysis of the returns of sheep and wool proves not only that our breeds are capable of such improvement, but that it has actually taken place.

In Vermont the greatest attention has been given to sheep-breeding; time, money, and intelligence having been freely applied to the great object of obtaining a breed combining weight and fineness of fleece. These efforts have succeeded so well, that although the number of sheep in that State had declined nearly one half in the period from the sixth to the seventh census, the yield of wool remained nearly the same. The average weight of the fleece in this State in 1840 was 2·2 lbs., and in 1850 it had increased to 3·71, the gain being almost equal to 70 per cent. In Massachusetts, also, where strenuous exertions have been made—though not on so large a scale as in Vermont—to improve their sheep, a correspondingly beneficial result has been obtained, and the average weight of the fleece has been increased from 2·5 to 3·1 lbs. The State of New York produced 226,000 lbs. more wool in 1850, from 3,453,000 sheep, than from 5,118,000 in 1840, showing that the weight of the fleece had been raised from less than two to nearly three pounds. Our imports of wool during ten years have varied as follows:

QUANTITY AND VALUE OF WOOL IMPORTED INTO THE UNITED STATES FROM 1841 TO 1850, INCLUSIVE.			
Years.	Quantity.	Value.	
1841.....	pounds 15,006,410	\$1,091,953	
1842.....	" 11,320,958	797,482	
1843—9 months	" 3,517,100	245,000	
1844.....	" 14,008,000	851,460	
1845.....	" 23,833,040	1,689,794	
1846.....	" 16,553,247	1,134,226	
1847.....	" 8,460,109	555,622	
1848.....	" 11,341,429	857,034	
1849.....	" 17,369,022	1,177,347	
1850.....	" 18,669,794	1,681,691	

By this statement it is shown that the quantity of wool brought into the country of late years amounts to almost one-third of that produced in it; while at former

periods, as from 1841 to 1845, the amount was nearly one half. The largest proportion of this imported wool came from Buenos Ayres and the neighboring states on the Rio de la Plata, and is of a coarse and cheap variety, costing from six to eight cents per pound. It always will be cheaper to bring this kind of wool from regions where sheep are reared without care or labor, than to produce it at home; but there is no country in the world in which sheep may, by judicious treatment, be made a source of greater wealth and comfort to its inhabitants than the United States. The importations of wool in 1850-'51 exhibit a remarkable increase over the preceding or any former year, amounting in quantity to 82,548,693 lbs., and to the value of \$3,800,000.

Woolen Manufacture, the art of forming wool into cloth and stuffs. The manufacture of cloth was known, it is supposed, in all civilized countries, and in very remote ages, and probably of linen also. Woolen cloths were made an article of commerce in the time of Julius Cæsar, and are familiarly alluded to by him. They were made in England before A.D. 1200, and the manufacture became extensive in the reign of Edward III., 1331. They were then called Kendal cloth and Halifax cloth.—E. B. See *article* WOOL. Blankets were first made in England about A.D. 1340.—CAMDEN. No cloth but of Wales or Ireland to be imported into England, 1463. The art of dyeing brought into England,

1608.—See *article* DYEING. Medleys, or mixed broad-cloth, first made, 1614. Manufacture of fine cloth begun at Sedan, in France, under the patronage of Cardinal Mazarine, 1646. British and Irish woollens prohibited in France, 1677. All persons obliged to be buried in woolen, or the persons directing the burial otherwise to forfeit £5, 29 Charles II., 1678. The manufacture of cloth greatly improved in England by Flemish settlers, 1688. Injudiciously restrained in Ireland, 11 William III., 1698. The exportation from Ireland wholly prohibited, except to certain ports of England, 1701. English manufacture encouraged by 10 Anne, 1712, and 2 George I., 1715. Greater in

Yorkshire in 1785, than in all England at the Revolution.—CHALMERS.

Woolen Goods, Varieties of.—The variety of goods which come under the designation of woolen manufactures is obviously increasing every year. "Broad-cloth" and "narrow cloth," "Clarendons" and "Petershams," "Cashmeres," "Cashmerettes," "kerseys," "tweeds," "tartans," "linsey-woolseys," "angolas," "vicuñas," "Venetians," "llamas," "Sardinians," "Himalayas," "moleskins," "doeskins," "beavers," "trowserings," "vestings," "coatings"—there is really no end to the names; for the manufacturers, not content with having distinguishing names for particular materials and particular modes of manufacture, conjure up new names, on any or no grounds, for the sake of novelty. Many of the names, however, might be made significant of really curious novelties in the manufacture. Thus there is a new "bis-unique cloth," of double thickness, the two surfaces having different patterns, so that the wearer may have either side outward at his pleasure. There is a cloth wholly made from beaver fur—soft, light, and warm—for winter garments. There is, as a third example, the comically-named Irish "rumswizzle," a very excellent brownish frieze made of undyed foreign wool.

Shoddy Trade.—The greater number, perhaps, of our readers may never have heard of that branch of the woolen manufacture called the *shoddy trade*, which has grown up of late years, and is now of very considerable value and importance. It is principally carried on at Dewsbury, in England, in the centre of the clothing district. Shoddy cloth is fabricated either wholly or partly of old wool; and instead of being neglected, or used only as manure, old woolen rags are now every where carefully collected, and conveyed to Dewsbury. After being subjected to various processes, they are torn to pieces by the aid of powerful machinery, and reduced to their original state of wool; and this wool, being respun, either with or without an admixture of fresh wool, is again made into cloth! Formerly, shoddy cloth was used only for padding and such like purposes; but now blankets, flushings, druggets, carpets, and table-covers, cloth for pilot and Petersham great-coats, etc., are either wholly or partly made of shoddy. The clothing of the army, and the greater part of that of the navy, consists principally of the same material, which, in fact, is occasionally worn by every body. Large quantities of shoddy cloth are exported. Great improvements have been effected of late years, not only in the fabric of the cloth, but also in the dyes: this is especially seen in the cloth for soldiers' uniforms, which is no longer of a brick-dust color, but makes a much nearer approach to scarlet. The beautiful woolen table-covers are made wholly of shoddy, being printed by *aqua fortis* from designs drawn in London and Manchester, and cut on holly and other blocks on the spot. The analogy between this manufacture and that of paper is so striking that it must force itself on the attention of every one, the vilest and most worthless materials being converted in both into the most beautiful and useful fabrics. The shoddy trade is, in fact, one of the greatest triumphs of art and civilization. Though of comparatively recent origin, it is rapidly extending itself. It is most active in summer, and is much more languid in winter.

United States.—The development and growth of our woolen manufactures depends now entirely upon our tariff. To enable our mills to compete with foreign mills, we must have a tariff to counteract the hostile legislation of those foreign countries which overrun our market with their fabrics. When England, France, Prussia, and Austria import wool for their broadcloths, free of duty, the United States must do the same; or these European manufacturers, in whose favor our tax on imported wool operates, will surpass us so largely in our own markets, that we shall be compelled to stop all our broadcloth spindles. This has been the effect

of the tariff of 1846 upon our woolen manufactures; and the prospect of relief to be afforded by Mr. Campbell's bill will give life to this decaying branch of our industry.

The relations of the tariff to our woolen manufactures has attracted so much attention of late, that the following table, showing the rate of duty fixed on wool by the various tariffs enacted by Congress since 1789, will be found interesting.

TARIFF DUTIES ON IMPORTED WOOL FROM 1789.

January, 1789, to April, 1816—free.
 April, 1816, to May, 1824—15 per cent. ad valorem.
 May, 1824, to June, 1825—costing under 10 cents per lb., 15 per cent. ad valorem.
 May, 1824, to June, 1825—costing over 10 cents per lb., 20 per cent. ad valorem.
 June, 1825, to June, 1826—costing under 10 cents per lb., 15 per cent. ad valorem.
 June, 1825, to June, 1826—costing over 10 cents per lb., 25 per cent. ad valorem.
 June, 1826, to June, 1828—costing under 10 cents per lb., 15 per cent. ad valorem.
 June, 1826, to June, 1828—costing over 10 cents per lb., 30 per cent. ad valorem.
 June, 1828, to June, 1829—4 cents per lb. specific, and 40 per cent. ad valorem.
 June, 1829, to June, 1830—4 cents per lb. specific, and 45 per cent. ad valorem.
 June, 1830, to June, 1832—4 cents per lb. specific, and 50 per cent. ad valorem.
 June, 1832, to June, 1842—costing under 8 cents per lb., free.
 June, 1832, to June, 1842—costing over 8 cents per lb., 4 cents specific, and 40 per cent. ad valorem.
 June, 1842, to July, 1846—costing under 7 cents per lb., 5 per cent. ad valorem.
 June, 1842, to July, 1846—costing over 7 cents per lb., 3 cents specific, and 30 per cent. ad valorem.
 July, 1846, to March 3, 1857—all wool 30 per cent. ad valorem.
 March 3, 1857, wool 24 per cent. Less than 20 cents a pound, at the place of exportation, free.

The fluctuations in this table are remarkable, and, considering their frequency and the extremes to which they run, it is surprising that capital should have been invested in woolen manufactures in this country.

"The statistics upon the production and importation of wool, and manufactures of wool, have been prepared with care, in order to place the questions connected with the production and importation of wool and manufactures of wool, involved in the proposition to admit wool as a raw material free of duty, fully and fairly before Congress. It will be seen that in 1840, according to the census of that year, we manufactured woolen goods to the value of \$20,696,999; and that in addition we imported manufactures of wool to the value of \$8,652,785; making our consumption of the manufactures of wool \$29,349,784, and the consumption of \$1 71 94-100 for each person then in the United States. The census of 1840 does not give the number of factories devoted to, nor the capital employed in the manufacture of wool. The census of 1850 shows there were 1559 factories in the United States, with 28,118,650 of capital devoted to the manufacture of wool, with the particular States in which the factories were situated; also that the manufactures of wool amounted to \$43,207,545, and we imported manufactures of wool to the value of \$16,976,575, making our consumption of manufactures of wool \$60,184,120, and the consumption of \$2 59½ for each person in the United States. If we estimate the increased value of our woolen manufactures since 1850 at the ratio of the increase between 1840 and 1850, it gives our manufactures of wool at \$56,406,786, for the year 1855; and we find the value of our importations of manufactures of wool for 1855 to be \$23,297,384, making our consumption \$79,704,170, and \$2 93 18-100 as the consumption of each person then in the United States. These tables also show, at the periods of 1840, 1850, and 1855, the value of the wool produced in the United States, and also the value of wool imported into the United States at the same periods, less the exports of wool. They also show the value of the wool, in the imported manufactures of wool, at each of those periods, estimating the value of

the wool at one-third of the value of the imports, and exhibit the value of the wool consumed by each person in 1840 at 71 26-100 cents; in 1850 at 75 18-100 cents; and in 1855 at 92 19-100 cents; and that we consumed in 1840 \$3,704,092 more than we produced; in 1850, \$7,317,771; and in 1855, \$9,678,690. There are no data from which to exhibit the number of factories, nor the amount of capital employed in the manufacture of wool, in 1855, nor the character of the goods manufactured; but it is represented that all our factories heretofore engaged in the manufacture of broad-cloths and the finer woolen fabrics have been forced to abandon that description of manufacture, and yield our markets for those articles to the foreign manufacturer. These tables show that in 1855 we consumed \$23,297,384 of the manufactures of wool more than we manufactured, and that we consumed \$9,678,690 of wool more than we produced, estimating the wool in the manufactured article at one-third of the value. Now we import \$1,940,697 of wool for our manufacturers, who pay a duty of 80 per cent. upon it; and we import \$23,297,384 of the manufactures of wool, on which we pay different rates of duty, viz.: 30 per cent. on part, 25 per cent. on part, and 20 per cent. on part; while with wool free of duty in other manufacturing countries, the duty operates a discrimination against the labor and capital of our own people. This is peculiarly the case as to the coarser fabrics, which we admit at less duty than we impose upon wool.

"The climate of the United States is such that manufactures of wool are used winter and summer in some of the States, and in the winter months in all, and the finer fabrics are used in all. It is an article, for clothing and other uses, that our climate and our habits do not permit us to dispense with, and which our people can and will manufacture for themselves, if our tariff laws are arranged so as not to discriminate against them, and in favor of other manufacturing nations.

"When we first imposed a tax on foreign wool, Great Britain and other manufacturing nations taxed it also, and as high as we taxed it. We discriminated in the tax upon the manufactures of wool, imposing a higher tax upon the finer fabrics; whereupon Great Britain and other manufacturing nations repealed their tax on wool, and secured to their manufacturers the advantage of obtaining the raw material free of duty. This advantage over us they will continue to enjoy as long as our tax is continued. The reasons why they admit wool free are to be found in the fact that they manufacture more than they produce, and it is necessary they should be able to sell cheap, in order to enter advantageously the markets of the world, and it may be also to secure the market of the United States, to the suppression of manufacturing in this country. We also manufacture more wool than we produce, and consume more manufactures of wool than we manufacture, and continue our tax on wool. The duty on wool was imposed to promote its production in the United States, and was expected to enhance the price. It has failed

to secure the object for which it was imposed. The production has not kept pace with our population and consumption of woolen manufactures, and although the prices have been fair, they have not been such as to make wool-growing as profitable a pursuit as many others in the country. In the trial of ten years under the tariff of 1816, there is no greater production of wool, in proportion to the population, than there was prior to that time. It is said we do not produce the inferior-priced wools, costing twenty cents per pound or less; nor the higher-priced wools, costing fifty cents or more to the pound, and that it is the lower and higher priced wools that we import for our manufactures, and that the duty has no effect, and does not enhance the price of the wool that we produce; in consequence of which we are undersold in our own markets, in both the finer and coarser fabrics; and that the repeal of the tariff on low and the higher priced wools would not affect the price of the wool we produce, and would enable our manufacturers to use more of our wool, by judicious mixture with foreign wool, and give them a fairer competition for the home market, and induce the manufacture of the finer fabrics in this country. There would be difficulty in the execution of such a tariff, because it would be the interest of the importer to put the foreign value of his wool above the fifty or below the twenty cents to obtain free entry. It is believed these causes would render the tax uncertain and unpopular, and make free trade in wool more desirable and more beneficial to the wool-grower as well as the manufacturer. In Great Britain the tax on the foreign wool, when it was as much as sixpence a pound, did not enhance the price to the English wool-grower, although it had been imposed and continued, as well to encourage the growth of wool at home as for revenue. The English prices-current and statistics show that the price of wool ranged higher the very first year after the duty was repealed than it had for years before, and has continued to range higher ever since. It is confidently believed such would be the case in this country if the duty on the importation of wool was repealed, thereby giving our manufacturers wool on the same terms the foreign manufacturers obtain theirs, viz.: by purchase in the open markets of the world, and that they would be encouraged to increase and extend their business in order to enjoy the benefit of the home market for their goods, the consequences of which would be a constant and greater home demand, at higher and better prices.

"The ratio at which our population is increasing will render necessary a continued increase in the manufactures of wool required for consumption. The importance of a home supply of this useful and indispensable article of clothing calls for the most careful investigation of the effects of our laws, and a prompt remedy by their repeal wherever they shall be found prejudicial to a constant and cheap supply from the capital and labor of our own people."—*U. S. Treasury Report*, December, 1856.

IMPORTS OF WOOLENS INTO THE UNITED STATES FOR THE YEARS ENDING JUNE 30, 1853, 1854, 1855.

Wreck, in Navigation, is usually understood to mean any ship or goods driven ashore, or found floating at sea in a deserted or unmanageable condition. But in the legal sense of the word in England, *wreck* must have come to land; when at sea, it is distinguished by the barbarous appellations of *flotsam*, *jetsam*, and *lagan*. In nothing, perhaps, has the beneficial influence of the advance of society in civilization been more apparent than in the regulations with respect to the persons and property of shipwrecked individuals. In most rude and uncivilized countries their treatment has been cruel in the extreme. Among the early Greeks and Romans strangers and enemies were regarded in the same point of view.—*Hostis apud antiquos, peregrinus dicebatur.*—*Pomp. Festus*; see also *CICERO de Offic.* Where such inhospitable sentiments prevailed, the conduct observed toward those that were shipwrecked could not be otherwise than barbarous; and in fact they were, in most instances, either put to death or sold as slaves. But as law and good order grew up, and commerce and navigation were extended, those who escaped from the perils of the sea were treated in a way less repugnant to the dictates of humanity; and at length the Roman law made it a capital offense to destroy persons shipwrecked, or to prevent their saving the ship; and the stealing even of a plank from a vessel shipwrecked or in distress made the party liable to answer for the whole ship and cargo.—*Pand.* 47, 9, 3.

During the gloomy period which followed the subversion of the Roman empire, and the establishment of the Northern nations in the southern parts of Europe, the ancient barbarous practices with respect to shipwreck were every where renewed. Those who survived were in most countries reduced to servitude, and their goods were every where confiscated for the use of the lord on whose manor they had been thrown.—*ROBERTSON'S Charles V.* But nothing, perhaps, can so strongly evince the prevalence and nature of the enormities as the efforts that were made, as soon as governments began to acquire authority, for their suppression. The regulations as to shipwreck in the Laws of Oleron are, in this respect, most remarkable. The 35th and 38th

articles state, that "pilots, in order to ingratiate themselves with their lords, did, like faithless and treacherous villains, sometimes willingly run the ship upon the rocks," etc.; for which offense they are held to be accused and excommunicated, and punished as thieves and robbers. The fate of the lord is still more severe. "He is to be apprehended, his goods confiscated and sold, and himself fastened to a post or stake in the midst of his own mansion-house, which being fired at the four corners, all shall be burned together; the walls thereof be demolished; the stones pulled down; and the site converted into a market-place, for the sale only of hogs and swine, to all posterity." The 31st article recites, that when a vessel was lost by running on shore, and the mariners had landed, they often, instead of meeting with help, "were attacked by people more barbarous, cruel, and inhuman, than mad dogs; who, to gain their moneys, apparel, and other goods, did sometimes murder and destroy these poor distressed seamen. In this case, the lord of the country is to execute justice, by punishing them in their persons and their estates; and is commanded to plunge them in the sea till they be half dead, and then to have them drawn forth out of the sea and stoned to death." Such were the dreadful severities by which it was attempted to put a stop to the crimes against which they were directed. The violence of the remedy shows better than any thing else how inveterate the disease had become.

But the fact that divines did not scruple to prostitute religious worship by praying that the adjacent coasts might be enriched with shipwrecks, affords, perhaps, the most striking proof of the barbarism of the times referred to. And incredible as it may seem, this practice was continued down to a comparatively recent epoch. "Cependant il y a encore en Allemagne des pays où la coutume de confisquer les biens naufragés n'est point encore abolie. Il y a même des endroits où les ministres prédicateurs ne font pas difficulté de prier Dieu en chaire qu'il se fasse bien des naufrages sur leurs côtes. Et ces prières, Thomasius a entrepris sérieusement de les justifier; mais par des raisons si singulières, qu'elles ne valaient pas la peine que Barbeyrac a prisé de les réfuter."—*VALIN, Commentaire sur l'Ordonnance de 1681*, ii. 586. See also *PUFFENDORFF, Droit de la Nature et des Gens*, par Barbeyrac, ii. 706.

The law of England, like that of other modern countries, adjudged wrecks to belong to the king. But the rigor and injustice of this law was modified so early as

the reign of Henry I., when it was ruled, that if any person escaped alive out of the ship, it should be no wreck. And after various modifications, it was decided, in the reign of Henry III., that if goods were cast on shore, having any marks by which they could be identified, they were to revert to the owners, if claimed any time within a year and a day. By the statute 27 Edw. III., c. 13, if a ship be lost and the goods come to land, they are to be delivered to the merchants, paying only a reasonable reward or SALVAGE (which see) to those who saved or preserved them. But these ancient statutes, owing to the confusion and disorder of the times, were very ill enforced; and the disgraceful practices previously alluded to continued to the middle of last century. A statute of Anne (12 Ann. st. 2, c. 18), confirmed by the 4 Geo. I., c. 12, in order to put a stop to the atrocities in question, orders all head officers and others of the towns near the sea, upon application made to them, to summon as many hands as are necessary, and send them to the relief of any ship in distress, on forfeiture of £100; and in case of any assistance given, salvage is to be assessed by three justices, and paid by the owners. Persons secreting any goods cast ashore are to forfeit treble their value; and if they willfully do any act by which the ship is lost or destroyed, they are guilty of felony without benefit of clergy. But even this statute seems not to have been sufficient to accomplish the end in view; and in 1753, a new statute (26 Geo. II., c. 19) was enacted, the preamble of which is as follows: "Whereas, notwithstanding the good and salutary laws now in being against plundering and destroying vessels in distress, and against taking away shipwrecked, lost, or stranded goods, many wicked enormities have been committed, to the disgrace of the nation, and the grievous damage of merchants and mariners of our own and other countries, be it," etc.; and it is then enacted, that the preventing of the escape of any person endeavoring to save his life, or wounding him with intent to destroy him, or putting out false lights in order to bring any vessel into danger, shall be capital felony. By the same statute, the pilfering of any goods cast ashore is made petty larceny.

We regret, however, to have to state that the plunder of shipwrecked property is still by no means uncommon on the British coasts. The committee on shipwrecks in 1843 state, that "there is on many parts of the coast a want of that moral principle which should inculcate a just regard for the rights of such property. It is looked upon as a chance gift, which every one has a right to scramble for as he can, notwithstanding the laws which have been passed, from the earliest period, to prevent or punish such depredations. The plunder of shipwrecked property on the coasts has been carried on to an enormous extent, and this seems to have arisen from there having been no persons on the spot, when a wreck had taken place, to look after the property." The committee state that the establishment of the coast-guard has done much to repress these abuses. The latter, however, can not legally interfere, except when the castaway articles are subject to customs duties; and the committee suggest that all abandoned property should be vested in the government in trust for those to whom it may belong, as is done in France and Holland.—*Report of Committee of 1843*, p. viii.

The old English doctrine of wrecks was founded upon the ancient laws of Europe, confiscating stolen goods on conviction of the thief, without paying any regard to the right of the real owner.

"By the common law, as it was laid down by Sir William Blackstone, goods wrecked were adjudged to belong to the king, and the property was lost to the owner. This he admits was not consonant to reason and humanity; and the rigor of the common law was softened by the statute of West. 1, 3 Edw. I., ch. 4, which declared that if any thing alive escaped the shipwreck, be it man or animal, it was not a legal wreck, and the

owner was entitled to reclaim his property within a year and a day. Upon this statute the legal doctrine of wrecks has stood to this day. St. Germain, the author of the *Doctor and Student*, did not seem to think that even the law under this statute stood with conscience, for why should the owner forfeit the shipwrecked goods, though it should happen that no man, dog, or cat (to use the words of the statute), should come alive unto the land out of the ship? The only rational ground of the claim on the part of the crown is, that the true owner can not be ascertained. The imperial edict of the Emperor Constantine was more just than the English statute, for it gave the wrecked goods in every event to the owner; "and this statute is upon just principles, not depending upon the casual escape of an animal." "The statutes of New York, Massachusetts, and other American States, are like the edict of Constantine," "for they declare that nothing that shall be cast by the sea upon the land shall be adjudged a wreck, but the goods shall be kept safely for the space of a year for the true owner, to whom the same is to be delivered on his paying a reasonable salvage; and if the goods be not reclaimed within that time, they shall be sold, and the proceeds accounted for the State."—*KENT'S Comm.*, Lect. XXXIV.

The journal of the *Société des Arts*, gives in a late number an analysis of the statistics of the wrecks which occurred upon the coasts and in the seas of the British Isles in the year 1856, as follows:

Years.	Wrecks.	Collisions.	Together.	Lives lost.
1852.....	458	57	1015	820
1853.....	759	73	832	989
1854.....	893	94	987	1549
1855.....	894	247	1141	469
1856.....	837	316	1153	521
Total.....	4841	787	5128	4848

This shows that the number of collisions at sea has regularly increased in a proportion truly frightful; from 57 in 1852, it became 316 in 1856, or five times greater.

For the year 1856, the number of wrecks and collisions is distributed monthly as follows: January, 149; February, 154; March, 96; April, 74; May, 57; June, 32; July, 48; August, 51; September, 98; October, 99; November, 129; December, 166; total, 1153. The tonnage of these vessels amounted to 229,936; the number of men employed to 16,014, of whom 521 perished.

Of the wrecked vessels, 314, or nearly one-third the entire number, were employed solely in the carriage of coals. The coal trade is, then, for England the most dangerous of all that which causes the greatest loss of life, no doubt because the vessels employed for this trade are badly selected, badly commanded, in a very bad condition, and indeed often quite unseaworthy.

Of these wrecks 506 occurred on the east coast, between Dungeness and Pentland Frith; 307 on the west, from Land's End to Greenock; 119 on the south, from Land's End to Dungeness; 155 on the coasts of Ireland; 12 upon the Isle of Scilly; 11 upon the Isle of Lundy; 5 upon the Isle of Man; and 36 upon the Isles of the North, Orkney, etc.

Of the causes which led to these losses there were 148 wrecks from storms; 17 abandoned on account of unseaworthiness; 37 sunk on same account; 10 losses from absence of proper signals; 33 from fogs and currents; 5 from defective compass; 3 from imperfect charts; 6 by error in calculation of the point; 12 by error of estimation; 7 by error of pilot; 3 through absence of pilot; 21 by neglect of soundings; 2 on account of drunkenness; 9 on account of general negligence; 10 by neglecting to heave to; 1 by coming in contact with a foundered vessel; 4 by fire; 4 by capsizing; 7 by causes unknown.

The Duties of Consular Officers.—By the third section of the act of Congress of April 14, 1792, consular officers, in cases where ships or vessels of the United States shall be stranded on the coast of their respective con-

sulates, are required, as far as the laws of the country permit, to take proper measures, as well for saving such ships or vessels, their cargoes, and appurtenances, as for storing and securing the effects and merchandise saved, and for taking an inventory or inventories thereof; and the merchandise and effects saved, with the inventory or inventories, must, after deducting therefrom the expense, be delivered to the owner or owners. But no consular officer is permitted to take possession of any such goods, wares, merchandise, or other property, when the master, owner, or consignee thereof is present, or capable of taking possession of the same. In the execution of the duties prescribed by this part of the act, every consular officer is instructed that all vessels, parts of vessels, and any portion of their cargo, belonging to citizens of the United States, saved, and brought into the consular jurisdiction after being wrecked, or in consequence of any disaster at sea, are to be proceeded with in the same manner as if the vessel had stranded within the consular jurisdiction; and if salvage be claimed and allowed by a competent tribunal, the remainder of the effects, or the proceeds thereof, if sold, shall be disposed of in the same manner as is directed in the twenty-first chapter of these instructions respecting the estates of persons dying intestate; provided, in the case of salvage, that the court deciding the same will permit the consular officer to receive the effects and remainder of the property after the salvage is paid. In some countries (as in Sweden) chartered companies have the privilege of taking possession of all property wrecked; in others it may be vested in particular magistrates or officers. In such cases the consular officer is not to interfere with the legal function of the proper officer, but he may ask leave, as the representative of the absent master or owner, or as his official adviser if he be present, to assist at the taking of the inventory, the sale, and all other proceedings in relation to the property. It is his duty to protect the interest of the owner, and, if his reasonable requests are not complied with, to take the necessary evidence of the facts in the case, and transmit it to the Department of State.

When any American vessel is wrecked within his jurisdiction, the consular officer is to give immediate notice to the Department of State, naming the vessel and her owners or master, and giving in detail as many of the circumstances attending the loss of the property as may be known at the time. When there is no impediment from the laws of the country, all proceedings in relation to property wrecked are to be the same as those prescribed in the case of property of intestates, and so also with regard to the taking possession and disposing of whatever effects, whether wrecked, abandoned, or otherwise, unrepresented within a consulate, belonging to any citizen of the United States. He will promptly render such assistance as may be in his power to his shipwrecked countrymen, and institute, whenever it is practicable, energetic proceedings for the protection of their property; but this instruction gives no authority to incur any expense therefor in the expectation of its being defrayed by the Department of State, the appropriation for the relief and protection of American seamen in foreign countries which is made by Congress not being applicable to such purposes. Whenever it is necessary for the safety of the property, the consular officer will apply to the local authorities for assistance.

Wreck of an American Vessel.—No parts of an American vessel, nor any of her equipments, wrecked either in our own or foreign waters, are to be regarded in legal contemplation as "goods, wares, or merchandise," when returned to the person or persons owning the vessel at the time of the wreck, and on proper proof of identification. If, however, they have been subjects of purchase and sale, they become "merchandise," within the meaning of the law, and, as such, become liable to duty on importation, according to their classification

under the tariff, and value determined by appraisement.

The parts or equipments of a foreign vessel wrecked in waters not of the United States, and brought into our ports, must be regarded, on importation into the United States, as merchandise, and liable to duty.

In the case of an American vessel bound on a coasting voyage from Buffalo to Detroit, and forced by stress of weather on the Canadian shore, where she was wrecked, it was decided by the Department that the merchandise recovered from the wreck was entitled to free entry, on being returned to the United States, on satisfactory proof that the articles of foreign origin composing her cargo had once paid duty in the United States, and that she was bound in good faith on a coasting voyage, with no intention of touching at a foreign port of destination.

The tackle, apparel, furniture, and ship stores of a foreign vessel wrecked on the coast of the United States, on being recovered and brought into the ports of the United States, to be admitted to free entry, not being considered as goods, wares, or merchandise subject to duty, within the meaning of the law.

Number of Shipwrecks.—The loss of property by shipwreck is very great. It appears from an examination of *Lloyd's List* from 1793 to 1829, that the losses in the British mercantile navy only amounted, at an average of that period, to about 557 vessels a year, of the aggregate burden of about 66,000 tons, or to above 1-40th part of its entire amount in ships and tonnage. The following account of the casualties of British shipping in 1829 is taken from *Lloyd's List*:

On foreign Voyages.—157 wrecked; 284 driven on shore, of which 224 are known to have been got off, and probably more; 21 foundered or sunk; 1 run down; 35 abandoned at sea, 8 of them afterward carried into port; 12 condemned as unseaworthy; 6 upset, 1 of them righted; 27 missing, one of them a packet, no doubt foundered. *Coasters and Colliers.*—109 wrecked; 297 driven on shore, of which 121 known to have been got off, and probably more; 67 foundered or sunk, 4 of them raised; 6 run down; 13 abandoned, 5 of them afterward carried in; 3 upset, 2 of them righted; 16 missing, no doubt foundered. During the year, 4 steam vessels were wrecked; 4 driven on shore, but got off; and 2 sunk. It seemed, from the returns given in the Report of the Commons' Committee of 1843 on Shipwrecks, that these casualties were becoming less frequent. At all events, it appeared that at an average of the three years ending with 1835, 610 ships were annually lost, and that notwithstanding the increase of shipping in the interval, at an average of 1841 and 1842, the annual loss amounted to only 611 ships; the average burden of the lost ships being in both cases, as near as can be ascertained, 210 tons. Hence, if we estimate the value of the ships and cargoes at £20 a ton, the loss of property in 1841 and 1842, from shipwreck only, will have been £2,566,200 a year! The loss of life is not exactly known, but it may be taken at from 1000 to 1500 individuals a year. The increased employment of steamships, the multiplication of lights, and the improvement of harbors, all tend to diminish the number of casualties; and yet they continue to be extremely numerous. In 1852, for example, when the mercantile navy of the United Kingdom (except the colonies) comprised 26,146 ships, there were 1115 wrecks. Of these 533 were total losses, and 582 were partial but heavy losses, the ships being obliged to discharge; 83 of the former, and 24 of the latter, were occasioned by collisions. The loss of lives was estimated at 920. These heavy losses might be diminished by building better and stronger ships. No doubt, however, the carelessness, ignorance, and incapacity of the masters is the great source of loss; and nothing, certainly, will do so much to obviate this as the plan now adopted of making the obtaining of a certificate of fitness, after undergoing an examination by a public board,

indispensable to enable any individual to be appointed to the command of a ship. During the war with France, 32 ships of the line went to the bottom, besides 7 fifty-gun ships, 86 frigates, and a vast number of smaller vessels. And the losses sustained by the navies of France, Spain, Holland, Denmark, etc., must have very greatly exceeded those of ours. Hence, as Mr. Lyell has observed, it is probable that a greater number of monuments of the skill and industry of man will, in the course of ages, be collected together in the bed of the ocean, than will be seen at one time on the surface of the continent.—*Principles of Geology*.

Writing. Pictures were undoubtedly the first essay toward writing. The most ancient remains of writing which have been transmitted to us are upon hard substances, such as stones and metals, used by the ancients for edicts, and matters of public notoriety. Athotes, or Hermes, is said to have written a history

of the Egyptians, and to have been the author of hieroglyphics, 2112 B.C.—**USHER.** Writing is said to have been taught to the Latins by Europa, daughter of Agenor, King of Phœnicia, 1494 B.C.—**THUCYDIDES.** Cadmus, the founder of Cadmea, 1493 B.C., brought the Phœnician letters into Greece.—**VOSSIUS.** The commandments were written on two tables of stone, 1491 B.C.—**USHER.** The Greeks and Romans used waxed table-books, and continued the use of them long after papyrus was known.—*See PAPHYRUS, PARCHMENT, PAPER.* "I would check the petty vanity of those who slight good penmanship, as below the notice of a scholar, by reminding them that Mr. Fox was distinguished by the clearness and firmness, Mr. Professor Porson by the correctness and elegance, and Sir William Jones by the ease and beauty, of the characters they respectively employed."—**DR. PARR.**

Y.

Yacht, formerly a vessel of state, usually employed to convey princes, ambassadors, and other great personages from one kingdom to another. As the principal design of a yacht is to accommodate the passengers, it is usually fitted with a variety of convenient apartments, with suitable furniture. Private pleasure-boats, when sufficiently large for a sea-voyage, are also termed *yachts*. A more modern use of the term is to designate the model boats built for speed and for racing.

Yachts of the present day include both steam and sailing vessels. The yacht *America*, built by Mr. Steers, of New York, and afterward the winner of the prize at the yacht race, 22d August, 1851, at Cowes, in England, gave American ship-wrights a wider reputation than before. Vessels belonging to the British, American, French, and Russian yacht clubs are released from quarantine upon the same conditions as ships of war in British ports.

By acts of Congress, the Secretary of the Treasury is authorized to cause yachts, used and employed exclusively as pleasure vessels, and designed as models of naval architecture, and entitled to be enrolled as American vessels, to be licensed on terms which will authorize them to proceed from port to port of the United States without entering or clearing at the custom-house. Such license shall be in such form as the Secretary of the Treasury may prescribe: Provided, such vessels so enrolled and licensed shall not be allowed to transport merchandise or carry passengers for pay: And provided, further, that the owner of any such vessel, before taking out such license, shall give a bond, in such form and for such amount as the Secretary of the Treasury shall prescribe, conditional that the said vessel shall not engage in any unlawful trade, nor in any way violate the revenue laws of the United States, and shall comply with the laws in all other respects.

All such vessels shall, in all respects except as above, be subject to the laws of the United States, and shall be liable to seizure and forfeiture for any violation of the provisions of this act.

All such licensed yachts shall use a signal, of the form, size, and colors prescribed by the Secretary of the Navy; and the owners thereof shall at all times permit the naval architects in the employ of the United States to examine and copy the models of said yachts.

Yanan, or Yanaon, a French settlement within the limits of the British presidency of Madras, situate near the bifurcation of the Godavery (a river rising in the Deccan), and the river or harbor of Coringa, and about nine miles above the embouchure of the former. The mouth of the Godavery is obstructed by sand-

banks, which preclude the entrance of ships; but the Coringa River has a deep channel, which admits of vessels of 200 tons burden proceeding as high as Yanan. The French territory dependent on the factory stretches along the banks of the two rivers a distance of six miles, and contains an area of 8147 acres, which in 1836 were classified as follows:

Land under cultivation.....	acres 4310
Woods and forests	" 862
Barren land	" 215
Public estates.....	" 2760

The population in 1840 was 6880. Lat. 16° 44', and long. 82° 16'.

Yard, a long measure used in England, of 3 feet, or 36 inches.—*See WEIGHTS and MEASURES.*

Yarn (Ger. *Garn*; Du. *Garen*; Fr. *Fil*; It. *Filato*; Sp. *Hilo*; Port. *Fio*; Russ. *Prasha*), wool, cotton, flax, etc., spun into thread.—*See articles COTTON, LINEN, WOOL, etc.*

Year, Lunar. This is the space of time which comprehends twelve lunar months, or 454 days, 8 hours, 48 minutes, and was in use among the Chaldeans, Persians, and ancient Jews. Once in every three years was added another lunar month, so as to make the solar and lunar year nearly agree. But though the months were lunar, the year was solar; that is, the first month was of thirty days, and the second of twenty-nine, and so alternately; and the month added triennially was called the second Adar. The Jews afterward followed the Roman manner of computation.—**HAYDN.** *See ALMANAC, CALENDAR.*

Yucatan, a peninsular state of Mexico, Central America, mostly between lat. 17° 30' and 21° 30' N., and long. 87° and 91° W., having north and west the Gulf of Mexico, east the Caribbean Sea, and landward British Honduras, Guatemala, Chiapas, and Tabasco. Area, 7364 square leagues, or 52,947 square miles. Population in 1850, 680,948. Surface mostly level, fertile in the south, but deficient in regular supplies of water, though so inundated in summer as greatly to impede agriculture, in which, as well as manufactures, it appears to be behind the more northern portions of Mexico. Cattle are numerous. Other chief sources of wealth are maize, cotton, rice, tobacco, pepper, sugarcane, dye-woods, hides, and soap, mostly exported from Campeachy and Sisal. It is divided into five dependencies and eighteen districts. Principal cities and towns, Merida, the capital, Valladolid, Isamal, Campeachy, and Tekao. It also comprises the remarkable ruins of Uxmal, Chi-chen, Kabah, and Zayi. The *Bay of Yucatan* is a name sometimes given to the sea immediately north of the Bay of Honduras. The *Channel of Yucatan*, between that country and Cuba, is 120 miles across.

Z.

Zaffer, or Zafre. After the sulphur, arsenic, and other volatile parts of cobalt have been expelled by calcination, the residuum is sold, mixed or unmixed with fine sand, under the above name. When the residuum is melted with silicious earth and potash, it forms a kind of blue glass, known by the name of smaltz (see SMALTZ), of great importance in the arts. When smaltz is ground very fine, it receives in commerce the name of *powder blue*. Zaffer, like smaltz, is employed in the manufacture of earthen-ware and China, for painting the surface of the pieces a blue color. It suffers no change from the most violent fire. It is also employed to tinge the crystal glasses, made in imitation of opaque and transparent precious stones, of a blue color. It is almost wholly brought from Germany.—See article DYES.

Zante, one of the Ionian islands, Mediterranean, eight miles south of Cephalonia. Lat. of north point, $37^{\circ} 56' 5''$ N., long. $20^{\circ} 41' 5''$ E. Length $2\frac{3}{4}$ miles, breadth 6 to 11 miles. Population in 1844, 38,929. Surface mountainous in the west, flat and well cultivated in the east. Climate mild, and the island still deserves to be called the flower of the Levant, but is subject to destructive earthquakes. It has numerous olive gardens and vineyards, and produces pomegranates, melons, peaches, and citrons; but its principal export is currants. A small quantity of wine is made, half of which is exported. Olive-oil is inferior in quality. Bitumen is procured from pits in the south, and salt is manufactured chiefly for home use. Zante, the capital and only town on the east coast, is the largest in the republic. Population, 20,000. It is well built, and its square has a monument to Sir T. Maitland; its port is protected by a wall, and has a light-house. It is the see of a Greek protopapas and a Roman Catholic bishop. It was nearly destroyed by an earthquake on 30th October, 1841. Of the recent changes in the commercial policy of the Ionian Islands, the following letter from the United States Consul at Zante, under date of October 4, 1855, gives the details:

"*Currants.*—The blight which has ruined the crops of three successive years has also damaged that of this year to such an extent that Zante has produced only 600,000 pounds, and Cephalonia 6,000,000 pounds of fruit, which has been already sold and shipped for England at the enormous price of \$100, \$120, and \$122 per thousand pounds. It is hoped that next year, by applying pulverized sulphur on the fruit before it gets attacked by the blight, the plants will yield an abundant crop. The experiment made this year has proved satisfactory. Cargoes of sulphur daily arrive from Sicily and Lombardy for this purpose.

"*Wine.*—The grape vine is affected to the same extent as the currant. The production of this year is not sufficient for local consumption.

"*Olive-oil.*—The crop of the year 1855 is very abundant. It is calculated thus: Zante, 60,000 barrels; Cephalonia, 6000 barrels; Sta. Maura, 30,000 barrels; Paxo and Ithaca, 30,000 barrels; Corfu, 150,000 barrels: total, 276,000 Ionian barrels for exportation. It is hoped that this enormous production will give vigor to trade and navigation, which has been for so many years in perfect stagnation. Besides the usual affairs for Austria, England, and France, a large quantity of this fluid will probably be exported to the ports of Russia at the Black Sea by Ionian vessels."

The principle upon which duties are levied upon goods imported in the Ionian Islands, is the flag under which these are transported. If by vessels of nations under treaty with these states, duty is from 10 to 14 per cent. less, according to articles, than on those forwarded by vessels of nations which are not under treaty. In this last condition the American flag stands, and this is the principal impediment to a more regular intercourse of business between the Ionian Islands and the United States. To stop this, there is but one way, namely, to put the American flag on an equal footing with the Ionian. To insure this, Ionian vessels must enjoy the same privileges in the United States that American vessels enjoy in the Ionian Isl-

ands. The negotiation must take place in London, through the American ambassador and the English government; because, according to the Ionian constitution, all diplomatic questions and agreements between these and foreign states must be attended to by the government of the protecting sovereign. This done, every other difficulty in introducing and encouraging American trade in this market can be easily obviated. The articles enumerated in the following table always find a ready market here. The islands provide also the eastern coasts of the kingdom of Greece and Albania with these articles by transit. All these articles, corn, etc., excepted, are imported here from second-hand markets. As regards freight, one example will suffice to prove whether it is worthy the attention of American navigation or not. A vessel of 200 tons chartered for the Black Sea, going in ballast, gets about \$3300, 5 per cent. primage, and a gratuity of about \$40 and even \$100, according to circumstances. Money can be returned to the United States for goods sold here by bills drawn through London at three months date. In order to obtain money on goods shipped for the United States, a credit must be opened in London to value with bills of lading. Legal interest on money, 10 per cent. per annum.

"*Olive-oil.*—All the islands produce this fluid, and export for Russia, England, and Trieste. Its price varies according to demand. The average price is from \$8 to \$10 per barrel. This is an extensive article of commerce, and one of the principal productions of the islands. It not only affords wealth to the natives of every class, and encourages commerce, but provides also the immense soap factories of the place with the principal material out of which soap is made for consumption and exportation.

"*Currants.*—All remedies, other than sulphur, adopted by proprietors to stop the blight have proved abortive. Sulphur only gave a happy result. Although this is a remedy upon which proprietors can now rely, still they have a great many difficulties to overcome before they see their hopes realized. The first of these is the fixing the epoch or time when the plants and fruit thereof are to be sulphured. This varies according to the quality of the soil, the temperature of the atmosphere, and the difference of climate of the various localities that produce currants. Besides these primitive difficulties, we perceive another, which we consider by far greater. The most part of the proprietors are so badly off, on account of the failure of the crop for four consecutive years, that it is absolutely out of their power to provide sulphur and encounter the expenses required for such an operation. Still, in spite of all these difficulties, it is generally hoped that the crop of this year will be comparatively abundant.

Zanzibar, or Zanguebar, an island off the east coast of Africa, lat. of town $6^{\circ} 27' 7''$ S., long. $39^{\circ} 33'$ E. Length of island about 40 miles, breadth 15 miles. Population upward of 200,000, consisting of Arabs, Sowily Africans, and Negro slaves. Population of the town of Zanzibar about 80,000. The island is the metropolis of the Imaum of Muscat's possessions on the east coast of Africa. The town called Shanganny is situated on a low point of sand, has a wooden fort, and is irregularly built. The situation is very unhealthy for Europeans. A considerable trade is carried on with Arabia, and the ports in the Red Sea. Between the west shore of the island and main land are dangerous shoals, and several islets, the largest of which is Tumbal. Ship-building, stone masonry, carpenters, goldsmiths, silversmiths, coppersmiths, and blacksmiths' work is carried on, besides manufactures of inferior cotton goods and trinkets. The exports are cloves, ivory, sharks' fins, sandal-wood, amber, shells, and cocoa-nuts.

The principal produce of the island is cloves—the annual produce being from 2,000,000 to 3,000,000 lbs., of which the sultan himself produces about 1,000,000 lbs. The value of American trade with Zanzibar may be estimated at about \$1,000,000 annually; it is carried on chiefly from Salem, Massachusetts. Outward cargoes consist almost exclusively of New England manufactured cotton goods, the consumption of which reaches an annual average of about 6000 bales. The return cargoes are composed of ivory, gum-copal, cloves, hides, and some minor articles. Voyages from the United States usually occupy a year—vessels always calling at the Persian Gulf and ports of the Red Sea. In 1851 there were ten or twelve American vessels, of about 250 tons each, regularly engaged in this trade. The relations existing between American houses (several of which have been for years established at Zanzibar) and the sultan and his officials are of the most friendly and liberal character. The stipulations of the treaty with the United States are faithfully observed, and every desirable commercial facility freely extended to American commerce.

Zea, Indian Corn, or Maize. See MAIZE.

Zedoary (Ger. *Züwer*; Fr. *Zédoaire*; It. *Zedoaria*; Sp. *Cedoaria*; Arab. *Judcar*; Hind. *Nirbisi*), the root of a plant which grows in Malabar, Ceylon, Cochin China, etc., of which there are three distinct species. It is brought home in pieces of various sizes, externally wrinkled, and of an ash color, but internally of a brownish red. Those roots which are heavy and free from worms are to be chosen, rejecting those which are decayed and broken. The odor of zedoary is fragrant, and somewhat like that of camphor; the taste biting, aromatic, and bitterish, with some degree of acrimony. It was formerly employed in medicine, but is scarcely ever used by modern practitioners.—MILBURN'S *Orient. Com.*

Zinc, or Spelter (Ger. *Zink*; Fr. *Zinc*; It. *Zinco*; Sp. *Zinco*, *Cinco*; Russ. *Schpikauter*; Lat. *Zincum*), a metal of a brilliant white color, with a shade of blue, composed of a number of thin plates adhering together. When this metal is rubbed for some time between the fingers, they acquire a peculiar taste, and emit a very perceptible smell. It is rather soft; tinging the fingers, when rubbed upon them, with a black color. The specific gravity of melted zinc varies from 6.861 to 7.1, the lightest being esteemed the purest. When hammered, it becomes as high as 7.1908. This metal forms, as it were, the limit between the brittle and the malleable metals. Its malleability is by no means to be compared with that of copper, lead, or tin; yet it is not brittle, like antimony or arsenic. When struck with a hammer, it does not break, but yields, and becomes somewhat flatter; and, by a cautious and equal pressure, it may be reduced to thin plates, which are supple and elastic, but can not be folded without breaking. When heated to about 400°, it becomes so brittle that it may be reduced to powder in a mortar. It possesses a certain degree of ductility, and may, with care, be drawn out into wire. Its tenacity is such, that a wire whose diameter is equal to $\frac{1}{10}$ th of an inch is capable of supporting a weight of about 26 lbs. Zinc has never been found in a state of purity. The word zinc occurs for the first time in the writings of Paracelsus, who died in 1541; but the method of extracting it from its ores was not known till the early part of last century.—THOMSON'S *Chemistry*. The compounds of zinc and copper are of great importance.—See BRASS.

The discovery of this metal, so far as the fact is known, is due to the moderns. It is said to have been long known in China, however, and is noticed by European writers as early as A.D. 1231; though the method of extracting it from the ore was unknown for nearly 500 years after. A mine of zinc was discovered in Yorkshire, England, in 1809. Zincography was introduced in London shortly after the invention of lithography became known in England, in 1817.—HAYDN.

Zinc Paint.—The zinc paint, now brought before public notice, illustrates at once the ingenuity shown in devising means for remedying an evil, and the difficulty of applying the remedy in opposition to popular custom. White-lead is deleterious to health, and nothing has succeeded in rendering it otherwise. Hence attempts are being made to find a substitute; and zinc seems at present the best fitted for this office. The manufacture of the white oxyd of zinc is a beautiful example of chemical action. Metallic zinc is heated in a furnace to which a current of air is admitted; the zinc vaporizes; the vapor passes into a series of chambers; and here it collects on the walls as a light downy flocculent oxyd, which is scraped off and removed. When ground up with linseed oil, the oxyd forms a white paint, which may be the ground or substance for other colors used in house-painting. Then comes the rivalry between the two "whites"—the oxyd of zinc and the carbonate of lead. The chemical virtues of the former are insisted upon; but the advocates for the latter have not failed to point out the qualities in which it is unquestionably the better of the two—especially in drying more quickly than the zinc white, and having more "body" or substance. One among many proposed modes of applying the zinc white is in floor-cloth painting. In this manufacture oil paint is laid on thickly, first with a brush and afterward through the medium of carved blocks. The quantity of paint consumed is so large, that the white-lead contained in it becomes a sad enemy to the men employed in the processes; and hence a recent attempt has been made to adopt zinc white as a substitute.

Zoll-Verein. The Germanic confederation of states for purposes of commerce came into practical operation by the treaty of March 22, 1833. Prior to that period, the states of which the union is composed did not allow of the introduction of merchandise across their respective frontiers without the payment of duties; numerous prohibitions existed, and the commercial relations between sovereignties, whose territories were contiguous, were fettered with oppressive and vexatious restrictions. To introduce a better system of commercial policy, and to remove all unnecessary burdens, which only tend to clog commercial enterprise and choke up the natural channels of trade between neighboring powers, these independent sovereignties have become, for commercial purposes, a consolidated government; one line of customs on the geographical boundary has been established; one tariff of duties on imports, exports, and transit, is enforced for all; and the revenue thus derived is distributed among the members of the confederation, in proportion to the population of each.—For exception to this mode of distributing the revenue, see FRANKFORT-ON-THE-MAINE.

The origin of this customs union may be traced to causes, political as well as commercial, having their existence long anterior to the treaty of 1833. Immediately after its organization, with Prussia at its head, had been proclaimed, alarms were spread throughout England, based upon the mistaken idea that the confederation was planned under the influence of Russia, as a part of her grand political scheme against British prosperity and influence; a fallacy which for a time

derived no inconsiderable plausibility from the adoption, by most of the states of the confederation, of the long-existing restrictive tariff of Prussia. British merchants became alarmed; and even the government itself shared, to some extent, in the popular delusion, which imagined the ruin of British trade, as the inevitable consequence of the united adoption, by nearly all the states of northern and southwestern Germany, of the commercial policy of the power which it was supposed the secret diplomacy of Russia had placed at the head of the *anti-British* league.

This delusion, however, was but of short duration; indeed, the general panic which it excited throughout England was quieted by the more experienced minds of that nation itself, who, viewing the formation of the Zoll-Verein in a more philosophic light, refuted the erroneous notions which had so generally obtained respecting it, and demonstrated its purely Germanic origin, by their panegyrics on those whose forecast and wisdom had conceived the project, and whose indomitable perseverance had accomplished its fulfilment. Among those whose able writings contributed most to enlighten England, as well as other nations, on the history and objects of the Zoll-Verein, Macgregor, the British statistician, occupies the first rank. Prussia, from her geographical position, was at that time more exposed to attack than any other country in Europe. Her Rhenish provinces weakened rather than strengthened her power. Easily accessible from Austria, Russia, and the Baltic, and, in the event of war, open to immediate attack on the side of France and Belgium, the Prussian cabinet was convinced that in the military strength of the territories possessed by Prussia before the treaty of Vienna consisted her only defensive strength. When the first French revolution broke out, Austria and several German states had to meet the troops of France long before they approached the Prussian frontiers; now the latter lay immediately exposed to an army marching in from France and Belgium. Hence the safety of Prussia depended, in the event of war, upon uniting all Germany by one common bond of mutual interest and security. Besides, the sagacity of the Prussian cabinet was doubly quickened by the French revolution of 1830, which had spread apprehension throughout the whole of Germany, particularly when the republican infection had spread among the students of the German universities, who, under the name of "Young Germany," had excited no little alarm on the part of the several German governments. The Belgian revolution succeeded; and then Austria shared in the apprehensions and uneasiness which had so long been felt by Prussia. The Polish revolution quickly followed; and now Prussia was ready to make any sacrifices in order to unite Germany under an apparently commercial, but in reality a political and national bond.

The necessity of such a union was at once promulgated with extraordinary industry. The press and the ablest political economists were enlisted in the general cause. Volumes were scattered among the people. The illiberal commercial systems of England and France; the prohibitory duties which Russia had just imposed on Poland, virtually closing the best market which Saxony had hitherto found for her fabrics—these considerations were strenuously urged to prove that a general union of fiscal interests was necessary for the present and future prosperity and protection of the country, and for maintaining Germany among the great powers of Europe. Their governments and people being thus prepared for union, the kingdoms of Prussia, Bavaria, Würtemberg, and Saxony, with Hesse Cassel, signed the treaty of March 22, 1833, organizing the German Customs Association, or Zoll-Verein. The Thuringian and other states, Baden, Nassau, and the free city of Frankfort-on-the-Maine, joined at subsequent periods; and on the 1st of January, 1851 (by treaty of September 7, 1851, between

Prussia and Hanover), Brunswick, Hanover, and Oldenburg. A new convention has been concluded, not varying, however, materially from the one it superseded, but providing that in January, 1858, commissioners from all the federal states shall meet at the place of sitting of the Diet, on being summoned by it, in order to bring into operation more extended relaxations than those now proposed; and then, if the now existing impediments (arising from the difference of circumstances and interests) to a perfect commercial and customs union of the whole of Germany are removed, to effect that union by way of treaty. In the mean time, by a separate article, every federal state is required to take care, in concluding or prolonging any treaties of commerce and traffic, that the same shall not hinder nor embarrass a complete commercial union of Germany, or a further approach thereto, at least not beyond the year 1858.

In the annual and triennial congress of delegates from the several states of the union, which the convention provides shall meet for settling the accounts, agreeing to alterations in the tariff, etc., Prussia has only one vote, like each of the other states. This, however, is not the only concession which she has made to the other sovereigns of the league. A reference to the geographical positions of the several states of the Zoll-Verein will show that many have no customs frontier to guard against smuggling, or along which to maintain custom-houses; while all receive an equal share of the revenue collected on goods entering along the general line of the boundary. The consequence is, that Prussia sacrifices about two millions of dollars annually to the revenues of the other states, exclusive of the fiscal loss sustained by the consumption of smuggled goods introduced along the Rhine, and along Lake Constance, into Baden, Würtemberg, and Bavaria. But Prussia was prepared for these, or even greater fiscal sacrifices, to realize the primary object of her policy—that of extending her power, as she may be said to have done, from the frontiers of France and Belgium to those of Austria and Russia—from the Alps to the Baltic; while the different states of Germany composing the union, by the removal of those barricades of national defense and international intercourse, and of the numerous lines of customs and customs officers which previously belted every large and petty state in Germany—by free trade among themselves, and the free opportunity of interchanging ideas and of receiving intelligence, may be said to have become consolidated and strengthened into one great nation.

Among the regulations of the Zoll-Verein, it is provided "that the advantage enjoyed by the inhabitants of the states of the union may be extended in reciprocity, according to circumstances, to foreign countries; while, on the contrary, disadvantageous restrictions imposed on the commerce of the union by foreign states should be retaliated by judicious measures, to be adopted for that purpose;" also, that the tariff of the union may be rectified every three years, and published for the next three years, eight weeks before the commencement of the first year—alteration in the rates of certain duties or items in the tariff to be made, if necessary, once a year, and to be published eight weeks before the 1st January, on which day such alteration to be in force. Article 23 of the convention provides "that a meeting of plenipotentiaries of the respective states shall be convened in June each year, to settle accounts, and agree to any change or modification of duties." By this article all the provisions for a change in the tariff have been retained. It therefore remains for other countries to reciprocate with the Zoll-Verein for an interchange of their respective productions and fabrics.

Natural Resources of the principal States composing the Zoll-Verein.—The states composing the Zoll-Verein possess the most abundant natural resources. The forests of Germany are extensive and valuable, and her mineral

riches are in many parts equal, and in some superior, to those of France. The soil, though in some parts of the north light and rocky, is generally fertile, and produces all kinds of corn and culinary vegetables, besides hemp, flax, tobacco, maize, etc.; while in the Rhenish countries, and in some parts south of Cologne, vineyards are extensively cultivated, which produce those agreeable and cool wines generally called Hock and Moselle, the consumption of which is rapidly increasing in the United States. The physical aspect of the states of the confederacy presents almost every feature of natural or cultivated appearance. "The lowlands, light soils, and alluvions of the north; the hilly country of Nassau; the undulations of Westphalia, of the Moselle, and west of the Rhine; the highlands of the Black Forest, and the Odenwald, Thuringia, and Suabia, of Darmstadt, Württemberg, and Baden, to the south; the mountains of the Harz and Taunus; the Erz-gebirge of Saxony; the valleys, plains, and heights of Silesia; the plains and Alps of Bavaria; the Rhine, Danube, Elbe, and numerous other rivers; rocks, corn-fields, vineyards, and pastures, are the principal aspect of the confederation."

In facilities for commercial intercommunication, nature has been equally bountiful to Germany. About sixty navigable rivers, or branches of rivers, intersect this country. They are generally connected by means of canals and railroads, some of which are still in progress of construction.

The Rhine, from its excellent navigation to the ocean, may be considered one vast port, the principal entrepôts of which are Cologne, Coblenz, Mayence, and Frankfort-on-the-Maine. The Danube carries down the produce of Germany to Austria, Hungary, and the Black Sea. The Elbe, navigable from Bohemia to Hamburg, and to the sea, waters Bohemia, Saxony, and Prussia, and is connected with the Danube by railroad, at a point where that river is navigable to Lintz, the capital of Upper Austria, from which steamboats ply to Vienna and the Black Sea. The Memel, and its numerous branches, bring down the timber and other produce of Poland and Lithuania to the ports of the Baltic; and the Oder and Vistula flow through Prussia, and are navigable to the Baltic.

On the 1st of January, 1854, the German Customs Union, or the Zoll-Verein, entered upon the third period of its existence. The first continued eight years—from the commencement of 1834 to the end of 1841; the second, twelve years—from the commencement of 1842 to the end of 1853; and the third, upon which it entered

at the beginning of 1854, is to continue also for twelve years. Two facts of importance mark the commencement of the third period: one, the accession of the Steuer-Verein; the other, the conclusion of a commercial treaty between Austria and Prussia, which may be regarded as the basis of a future Austro-Germanic Customs League. The following recapitulation of facts connected with these two important events are compiled from official documents, and are deemed necessary to a clear comprehension of the present as well as of the prospective *status* of the Zoll-Verein. On the 7th of September, 1851, the two kingdoms of Prussia and of Hanover separately concluded a treaty of a customs union, which, ten years before, had been a subject of fruitless negotiation, reserving the question of a union between their respective Customs Associations (the Zoll-Verein and the Steuer-Verein). As the stipulations of this treaty would require a reconstruction of the Zoll-Verein, and, consequently, a renunciation of the treaty of 1841 between the old members of that league, the Prussian cabinet, in the following November, gave notice of this renunciation, not for the purpose of retiring from a league so beneficial in all its results, but with a view of reorganizing it on a new basis. The Prussian government further gave notice that it would soon communicate propositions to that end, and that a conference, or congress, to take the subject into consideration, would assemble at Berlin.

The following statement will prove interesting, as exhibiting the revenue and population of the Zoll-Verein from its commencement down to the year 1851:

Years.	Population.	Revenue in Thalers.
1834.....	23,478,120	14,515,722
1835.....	23,478,120	16,580,180
1836.....	25,150,216	18,462,873
1837.....	25,150,698	17,997,295
1838.....	26,048,970	20,419,287
1839.....	26,048,971	20,869,483
1840.....	26,048,091	21,606,191
1841.....	27,124,116	22,295,452
1842.....	27,578,710	23,788,794
1843.....	27,623,815	25,762,023
1844.....	28,498,186	26,850,794
1845.....	28,499,566	27,915,956
1846.....	28,506,486	26,701,969
1847.....	29,461,381	27,834,668
1848.....	29,460,764	28,083,138
1849.....	29,461,093	24,144,573
1850.....	29,800,063	23,525,092
1851.....	29,728,335	22,545,687

—*Com. Rel. U. S.* For the port regulations of Prussia, see PRUSSIA; and for more extended information regarding the states composing the Zoll-Verein the reader is referred to the articles on the states separately.
